Novel antisense compounds targeted to nucleic acids encoding human superoxide dismutase 1, for modulating expression of the dismutase and treating diseases or conditions, e.g. amyotrophic lateral sclerosis.

4PI; 2003-184032/18.

Example 15; Page 77; 107pp; English.

The invention relates to a compound of 8-50 nucleobases in length,

targeted to a nucleic acid molecule encoding human superoxide dismutase

1. The compound specifically hybridises with and inhibits the expression

of human superoxide dismutase 1 by hybridising with at least an 8
concleobase portion of the nucleic acid molecule encoding the active site

of the enzyme. The activity of compounds of the invention may be

confounded as neuropycretive, cytostatic and antinflammatory. The

confounds of action of compounds of the invention is antisense inhibition

of human superoxide dismutase 1 expression by chimeric phosphorothioate

conjugnucleotides having 2'-methoxyethyl (2'-MOB) wings and a deoxy gap.

Compounds of the invention are useful for inhibiting the expression of

chuman superoxide dismutase 1 in human cells or tissues, and for treating

a disease or condition associated with this enzyme (antisense therapy),

a disease or condition associated with this enzyme (antisense therapy),

especially amyotrophic lateral sclerosis, a disease or condition arising

from aberrant apoptosis and a hyperproliferative disorder. It may also be

used in diagnostics, therapeutics and as a research reagent, e.g.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    The invention relates to a compound of 8-50 nucleobases in length, targeted to a nucleic acid molecule encoding human superoxide dismutase 1. The compound specifically hybridises with and inhibits the expression of human superoxide dismutase 1 by hybridising with at least an 8-nucleobase portion of the nucleic acid molecule encoding the active site of the enzyme. The activity of compounds of the invention may be
formation. Sequences given in records ACC40880-ACC40957 represent human superoxide dismutase 1 antisense inhibitor oligonucleotides

described as neuroprotective, cytostatic and antiinflammatory. The mechanism of action of compounds of the invention is antisense inhibition of human superoxide dismutase 1 expression by chimeric phosphororchioate oligonucleotides having 2' methoxyethyl (2'-MOE) wings and a deoxy gap. Compounds of the invention are useful for inhibiting the expression of human superoxide dismutase 1 in human cells or tissues, and for treating a disease or condition associated with this enzyme (antisense therapy), especially amyotrophic lateral sclerosis, a disease or condition arising from aberrant apoptosis and a hyperproliferative disorder. It may also be used in diagnostics, therapeutics and as a research reagent, e.g. prophylactically to prevent or delay infection, inflammation or tumour formation. Sequences given in records ACC40880-ACC40857 represent human superoxide dismutase 1 antisense inhibitor oligonucleotides
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Human; superoxide dismutase 1; antisense; neuroprotective; cytostatic; antiinflammatory; amyotrophic lateral sclerosis; apoptosis; hyperproliferative disorder; therapy; infection; inflammation; tumour;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Gaps

```
The invention relates to a compound of 8-50 nucleobases in length, targeted to a nucleic acid molecule encoding human superoxide dismutase targeted to a nucleic acid molecule encoding human superoxide dismutase 1. The compound specifically hybridises with and inhibits the expression of human superoxide dismutase 1 by hybridising with at least an 8-concleobase portion of the nucleic acid molecule encoding the active site of the enzyme. The activity of compounds of the invention may be described as neuroprotective, cytostatic and antiinflammatory. The mechanism of action of compounds of the invention is antisense inhibition of human superoxide dismutase 1 expression by chimeric phosphorothicate oligonucleotides having 2-methoxyethy1 (2'-MoE) wings and a deoxy gap. Compounds of the invention are useful for inhibiting the expression of human superoxide dismutase 1 in human cells or tissues, and for treating compounds of the invention associated with this enzyme (antisense therapy), especially amyotrophic lateral sclerosis, a disease or condition arising from aberrant apoptosis and a hyperproliferative disorder. It may also be used in diagnostics, therapeutics and as a research reagent, e.g. prophylactically to prevent or delay infection, inflammation or tumour formation. Sequences given in records ACC40080-ACC40057 represent human superoxide dismutase 1 antisense inhibitor oligonucleotides
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            / not \overline{e} = "Phosphorothioate linkages. All cytosines are 5-methylcytosine"
superoxide dismutase 1, for modulating expression of the dismutase and treating diseases or conditions, e.g. amyotrophic lateral sclerosis.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Human; superoxide dismutase 1; antisense; neuroprotective; cytostatic; antinflammatory; amyotrophic lateral sclerosis; apoptosis; hyperproliferative disorder; therapy; infection; inflammation; tumour;

The invention relates to a compound of 8-50 nucleobases in length, targeted to a nucleic acid molecule encoding human superoxide dismutase compound specifically hybridises with and inhibits the expression of human superoxide dismutase 1 by hybridising with at least an 8-concleobase portion of the nucleic acid molecule encoding the active site of the enzyme. The activity of compounds of the invention may be described as neuroprotective, cytostatic and antiinflammatcry. The mechanism of action of compounds of the invention is antisense inhibition of human superoxide dismutase 1 expression by chimeric phosphorothicate compounds of the invention are useful for inhibiting the expression of human superoxide dismutase 1 in human cells or tissues, and for treating a disease or condition associated with this enzyme (antisense therapy), especially amyotrophic lateral sclerosis, a disease or condition arising the apprecial sclerosis, a disease or condition arising the apprecial scheme and a hyperproliferative disorder. It may also be the condition and a proper and a processing and a hyperproliferative disorder. It may also be
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              used in diagnostics, therapeutics and as a research reagent, e.g. prophylactically to prevent or delay infection, inflammation or tumour formation. Sequences given in records ACC40880-ACC40957 represent human superoxide dismutase 1 antisense inhibitor oligonucleotides
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   1. .20

The invention relates to a compound of 8-50 nucleobases in length, targeted to a nucleic acid molecule encoding human superoxide dismutase

1. The compound specifically hybridises with and inhibits the expression of human superoxide dismutase 1 by hybridising with at least an 8-

2. Of human superoxide dismutase 1 by hybridising with at least an 8-

2. Compounds of the nucleic acid molecule encoding the active site of the enzyme. The activity of compounds of the invention may be described as neuroprotective, cytostatic and antiinflammatory. The mechanism of action of compounds of the invention is antisense inhibition of human superoxide dismutase 1 expression by chimeric phosphorothioate.

2. Compounds of the invention are useful for inhibiting the expression of human superoxide dismutase 1 in human cells or tissues, and for treating a disease or condition associated with this enzyme (antisense therapy).

2. Sepecially amyotrophic lateral sclerosis, a disease or condition arising from aberrant apptosis and a hyperproliferative disorder. It may also be used in diagnostics, therapeutics and as a research reagent, e.g.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            formation. Sequences given in records ACC40880-ACC40957 represent human superoxide dismutase 1 antisense inhibitor oligonucleotides
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Novel antisense compounds targeted to nucleic acids encoding human superoxide dismutase 1, for modulating expression of the dismutase and treating diseases or conditions, e.g. amyotrophic lateral sclerosis.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             δ
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                The invention relates to a compound of 8-50 nucleobases in length, targeted to a nucleic acid molecule encoding human superoxide dismutase CC targeted to a nucleic acid molecule encoding human superoxide dismutase 1 by hybridises with and inhibits the expression of human superoxide dismutase 1 by hybridising with at least an 8 cc of human superoxide dismutase 1 by hybridising with at least an 8 cc of the enzyme. The activity of compounds of the invention may be described as neuroprotective, cytostatic and antinflammatory. The mechanism of action of compounds of the invention is antisense inhibition of human superoxide dismutase 1 expression by chimeric phosphorothioate collgonucleotides having 2'-methoxyethyl (2'-MOE) wings and a deoxy gap. Compounds of the invention are useful for inhibiting the expression of human superoxide dismutase 1 in human cells or tissues, and for treating compounds of the invention associated with this enzyme dartisense therapy), especially amyotrophic lateral sclerosis, a disease or condition arising from abscrant apoptosis and a hyperproliferative disorder. It may also be used in diagnostics, therapeutics and as a research reagent, e.g. therapeutics and as a research reagent.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        formation. Sequences given in records ACC40880-ACC40957 represent human superoxide dismutase 1 antisense inhibitor oligonucleotides
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     superoxide dismutase 1, for modulating expression of the dismutase and treating diseases or conditions, e.g. amyotrophic lateral sclerosis.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Human, superoxide dismutase 1, antisense, neuroprotective, cytostatic, antiinflammatory, amyotrophic lateral sclerosis; apoptosis; hyperproliferative disorder; therapy, infection; inflammation; tumour;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Gaps

ACC40929;
```

The invention relates to a compound of 8-50 nucleobases in length, targeted to a nucleic acid molecule encoding human superoxide dismutase

1. The compound specifically hybridises with and inhibits the expression of human superoxide dismutase 1 by hybridising with at least an 8-concloses portion of the nucleic acid molecule encoding the active site of the enzyme. The activity of compounds of the invention may be described as neuroprotective, cytostatic and antinflammatory. The mechanism of action of compounds of the invention is antisense inhibition of human superoxide dismutase 1 expression by chimeric phosphorothioate conjonucleotides having 2-mechanyethy1 (2-moR) wings and a deoxy gap. Compounds of the invention are useful for inhibiting the expression of human superoxide dismutase 1 in human cells or tissues, and for treating a disease or condition associated with this enzyme (antisense therapy), especially amyotrophic lateral sclerosis, a disease or condition arising from abberrant apoptosis and a hyperproliferative disorder. It may also be used in diagnostics, therapeutics and as a research reagent, e.g. used in diagnostics, therapeutics and as a research reagent, e.g. prophylactically to prevent or delay infection, inflammation or tumour formation. Sequences given in records ACC40880-ACC40957 represent human superoxide dismutase I antisense inhibitor oligonucleotides

Sequence 20 BP; 6 A; 4 C; 3 G; 7 T; 0 U; 0 Other;

described as neuroprotective, cytostatic and antiinflammatory. The mechanism of action of compounds of the invention is antisense inhibition of human superoxide dismutase 1 expression by chimeric phosphorothioate oligonuclectides having 2-methoxyethyl (2'-MOS) wings and a deoxy gap. Compounds of the invention are useful for inhibiting the expression of human superoxide dismutase 1 in human cells or tissues, and for treating a disease or condition associated with this enzyme (antisense therapy), especially amyotrophic lateral sclerosis, a disease or condition arising from aberrant apoptosis and a hyperproliferative disorder. It may also be used in diagnostics, therapeutics and as a research reagent, e.g. prophylactically to prevent or delay infection, inflammation or tumour formation. Sequences given in records ACC40980-ACC40957 represent human superoxide dismutase 1 antisense inhibitor oligonucleotides
1. The compound specifically hybridises with and inhibits the expression of human superoxide dismutese 1 by hybridising with at least an 8-nucleobase portion of the nucleic acid molecule encoding the active site of the enzyme. The activity of compounds of the invention may be
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Human, superoxide dismutase 1, antisense; neuroprotective; cytostatic; antiinflammatory; amyotrophic lateral sclerosis; apoptosis; hyperproliferative disorder; therapy; infection; inflammation; tumour;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                g
                                                                                                                                                     The invention relates to a compound of 8-50 nucleobases in length, targeted to a nucleic acid molecule encoding human supercxide dismutase targeted to a nucleic acid molecule encoding human supercxide dismutase to thuman superoxide dismutase 1 by hybridising with at least an 8-control of the enzyme. The activity of compounds of the invention may be described as neuroprotective, cytostatic and antiinflammatory. The mechanism of action of compounds of the invention is antisense inhibition of human superoxide dismutase 1 expression by chimeric phosphorothibate oligonucleotides having 2'-methoxyethyl (2'-MCB) wings and a deoxy gap. Compounds of the invention are useful for inhibiting the expression of human superoxide dismutase 1 in human cells or tissues, and for treating candisease or condition associated with this enzyme (antisense therapy), especially amyotrophic lateral sclerosis, a disease or condition arising for treating the aberrant apoptosis and a hyperproliferative disorder. It may also be
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           ö

The invention relates to a compound of 8-50 nucleobases in length, targeted to a nucleic acid molecule encoding human superoxide dismutase 1. The compound specifically bybriddises with and inhibits the expression of human superoxide dismutase 1 by hybriddising with at least an 8-compounds portion of the nucleic acid molecule encoding the active site of the enzyme. The activity of compounds of the invention may be described as neuroprotective, cytostatic and antinflammatory. The mechanism of action of compounds of the invention is antisense inhibition of human superoxide dismutase 1 expression by chimeric phosphorothicate coligonucleotides having 2'-methoxyethyl (2'-McE) wings and a deoxy gap. Compounds of the invention are useful for inhibiting the expression of human superoxide dismutase 1 in human cells or tissues, and for treating a disease or condition associated with this enzyme (antisense therapy), especially amyotrophic lateral sclerosis, a disease or condition arising from aberrant apoptosis and a hyperproliferative disorder. It may also be
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Human; superoxide dismutase 1; antisense; neuroprotective; cytostatic; antiinflammatory; amyotrophic lateral sclerosis; apoptosis; hyperproliferative disorder; therapy; infection; inflammation; tumour;
                                                                                                                                                                                                                                                                                                                                                                                                     Novel antisense compounds targeted to nucleic acids encoding human superoxide dismutase 1, for modulating expression of the dismutase ar treating diseases or conditions, e.g. amyotrophic lateral sclerosis.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           used in diagnostics, therapeutics and as a research reagent, e.g. prophylactically to prevent or delay infection, inflammation or termation. Sequences given in records ACC40880-ACC40557 represent superoxide dismutase I antisense inhibitor oligonucleotides
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Human superoxide dismutase 1 antisense inhibitor # ISIS 150445

The invention relates to a compound of 8-50 nucleobases in length, targeted to a nucleic acid molecule encoding human superoxide dismutase

1. The compound specifically hybridises with and inhibits the expression of the mucleobase with and inhibits the expression of the nucleic acid molecule encoding the active site of the enzyme. The activity of compounds of the invention may be described as neuroprotective, cytostatic and antiinflammatory. The mechanism of action of compounds of the invention is antisense inhibition of human superoxide dismutase 1 expression by chimeric phosphorothicate of only onuclectides having 2'-methoxyethyl (2'-MOE) wings and a deoxy gap. Compounds of the invention are useful for inhibiting the expression of human superoxide dismutase 1 in human cells or tissues, and for treating a disease or condition associated with this enzyme (antisense therapy), especially amyotrophic lateral soletosis, a disease or condition arising from a hyperpoliferative disorder. It may also be for the discontinuation of the invention and a hyperpoliferative disorder.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              used in diagnostics, therapeutics and as a research reagent, e.g. prophylactically to prevent or delay infection, inflammation or tumour formation. Sequences given in records ACC40880-ACC40957 represent human superoxide dismutase 1 antisense inhibitor oligonucleotides

The invention relates to a compound of 8-50 nucleobases in length, targeted to a nucleic acid molecule encoding human superoxide dismutase

1. The compound specifically hybridises with an inhibite the expression of human superoxide dismutase 1 by hybridises with at least an 8-nucleobase portion of the nucleic acid molecule encoding the active site of human superoxide dismutase 1 by hybridises of the invention may be described as neuroprotective, cytostatic and antinflammatory. The mechanism of action of compounds of the invention is antisense inhibition of human superoxide dismutase 1 expression by chimeric phosphorothicate oligonucleotides having 2-methoxyethy1 (2-MoE) wings and a deoxy gap. Compounds of the invention are useful for inhibiting the expression of human superoxide dismutase 1 in human cells or tissues, and for treating a disease or condition associated with this enzyme (antisense therapy), a disease or condition associated with this enzyme distinger the expression of respecially amyotrophic lateral sclerosis, a disease or condition arising from aberrant apoptosis and a hyperproliferative disorder. It may also be used in diagnostics, therapeutics and as a research reagent, e.g. prophylactically to prevent or delay infection, inflammation or tumour formation. Sequences given in records ACC40080-ACC400857 represent human superoxide dismutase 1 antisense inhibitor oligonucleotides
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              ö

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        The invention relates to a compound of 8-50 nucleobases in length, targeted to a nucleic acid molecule encoding human superoxide dismutase.

1. The compound specifically hybridises with and inhibits the expression of human superoxide dismutase 1 by hybridising with at least an 8-

1. The compound specifically hybridises with and inhibits the expression of human superoxide dismutase 1 by hybridising with a least an 8-

1. The compound of the nucleic acid molecule encoding the active site of the enzyme. The activity of compounds of the invention may be described as neuroprotective, cytostatic and antinflammatory. The mechanism of action of compounds of the invention is antisense inhibition of human superoxide dismutase 1 expression by chimeric phosphorothicate oligonucleotides having 2'-methoxyethy1 (2'-moB) wings and a deoxy gap.

1. Compounds of the invention are useful for inhibiting the expression of human superoxide dismutase 1 in human cells or tissues, and for treating compounds of the invention associated with this enzyme (antisense therapy), especially amyotrophic lateral sclerosis, a disease or condition arising from aberrant apoptosis and a hyperproliferative disorder. It may also be used in diagnostics, therapeutics and as a research reagent, e.g. prophylactically to prevent or delay infection, inflammation or tumour formation. Sequences given in records ACC40080-ACC40057 represent human guperoxide dismutase 1 antisense inhibitor oligonucleotides
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     /note= "Phosphorothioate linkages.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   The invention relates to a compound of 8-50 nucleobases in length, targeted to a nucleic acid molecule encoding human superoxide dismutase 1. The compound specifically hybridises with and inhibits the expression of human superoxide dismutase 1 by hybridising with at least an 8-nucleobase portion of the nucleic acid molecule encoding the active site of the enzyme. The activity of compounds of the invention may be described as neuroprotective, cytostatic and antiinflammatory. The mechanism of action of compounds of the invention is antisense inhibition of human superoxide dismutase 1 expression by chimeric phosphorothioate
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    /mod_base= OTHER

oligonucleotides having 2'-methoxyethyl (2'-MOE) wings and a deoxy gap. Compounds of the invention are useful for inhibiting the expression of human superoxide dismutase 1 in human cells or tissues, and for treating a disease or condition associated with this enzyme (antisense therapy), especially amyorrophic lateral sclerosis, a disease or condition arising from aberrant apoptosis and a hyperproliferative disorder. It may also be used in diagnostics, therapeutics and as a research reagent, e.g. prophylactically to prevent or delay infection, inflammation or tumour formation. Sequences given in records ACC40880-ACC40857 represent human superoxide dismutase 1 antisense inhibitor oligonucleotides
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Human; superoxide dismutase 1; antisense; neuroprotective; cytostatic; antiinflammatory; amyotrophic lateral sclerosis; apoptosis; hyperproliferative disorder; therapy; infection; inflammation; tumour;

The invention relates to a compound of 8-50 nucleobases in length, targeted to a nucleic acid molecule encoding human superoxide dismutase to The compound specifically hybridises with and inhibits the expression of human superoxide dismutase 1 by hybridising with at least an 8-concleobase portion of the nucleic acid molecule encoding the active site of human superoxide dismutase 1 by hybridising with at least an 8-concleotion of the nucleic and antiinflammatory. The described as neuroprotective, cytostatic and antiinflammatory. The mechanism of action of compounds of the invention is antisense inhibition of human superoxide dismutase 1 expression by chimeric phosphorothioate oligonucleotides having 2'-methoxyethy1 (2'-MoB) wings and a deoxy gap. Compounds of the invention are useful for inhibiting the expression of human superoxide dismutase 1 in human cells or tissues, and for treating compounds of the invention associated with this enzyme (antisense therapy), especially amyotrophic lateral sclerosis, a disease or condition arising from aberrant apoptosis and a hyperproliferative disorder. It may also be used in diagnostics, therapeutics and as a research reagent, e.g. prophylactically to prevent or delay infection, inflammation or tumour formation. Sequences given in records Acc40080-ACC40057 represent human consumption. Sequences given in records Acc40057 represent human superoxide dismutase 1 antisense inhibitor oligonucleotides
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           o;

                                                                                                                                                                                                                                                                                                                                                                 Bennett FC,
The invention relates to a compound of 8-50 nucleobases in length, targeted to a nucleic acid molecule encoding human superoxide dismutase (1. The compound specifically hybridises with and inhibits the expression of human superoxide dismutase 1 by hybridisely with at least an 8-conflower portion of the nucleic acid molecule encoding the active site of human superoxide dismutase 1 by hybridisely with at least an 8-conflower the activity of compounds of the invention may be castribed as neuroprotective, cytostatic and antinflammatory. The mechanism of action of compounds of the invention is antisense inhibition of human superoxide dismutase 1 expression by chimeric phosphorothicate oligonucleotides having 2'-methoxyethyl (2'-MOE) wings and a deoxy gap. Compounds of the invention are useful for inhibiting the expression of human superoxide dismutase 1 in human cells or tissues, and for treating compounds of dismutase 1 in human cells or tissues, and for treating captern abortant apoptosis and a hyperproliferative disorder. It may also be used in diagnostics, therapeutics and as a research reagent, e.g. used in diagnostics, therapeutics and as a research reagent, e.g. prophylactically to prevent or delay infection, inflammation or tumour formation. Sequences given in records ACC40880-ACC40957 represent human constructive disported theman constructive dispondent continues and the confident or delay infection, inflammation or tumour construction.
                                                                                                                                                                                Novel antisense compounds targeted to nucleic acids encoding human superoxide dismutase 1, for modulating expression of the dismutase ar treating diseases or conditions, e.g. amyotrophic lateral sclerosis.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Sequence 20 BP; 4 A; 9 C; 5 G; 2 T; 0 U; 0 Other;

The invention relates to a compound of 8-50 nucleobases in length, cargeted to a nucleic acid molecule encoding human superoxide dismutase to targeted to a nucleic acid molecule encoding human superoxide dismutase 1. The compound specifically hybridises with and inhibits the expression of human superoxide dismutase 1 by hybridising with at least an 8 cm of the nucleic acid molecule encoding the active site of the enzyme. The activity of compounds of the invention may be described as neuroprotective, cytostatic and antinflammatory. The compounds of action of compounds of the invention is antisense inhibition of of human superoxide dismutase 1 expression by chimeric phosphorothioste coligonucleotides having 2-methoxyethy1 (2'-mos) wings and a deoxy gap. Compounds of the invention are useful for inhibiting the expression of human superoxide dismutase 1 in human cells or tissues, and for treating a disease or condition associated with this enzyme (antisense therapy), especially amyotrophic lateral sclerosis, a disease or condition arising from aberrant apoptosis and a hyperproliferative disorder. It may also be used in diagnostics, therapeutics and as a research reagent, e.g. used in diagnostics, therapeutics and as a research reagent, e.g. trophylactically to prevent or delay infection, inflammation or tumour formation. The invention relates to a compound of 8-50 nucleobases in length, targeted to a nucleic acid molecule encoding human superoxide dismutase 1. The compound specifically hybridises with and inhibits the expression of human superoxide dismutase 1 by hybridising with at least an 8-nucleobase portion of the nucleic acid molecule encoding the active site of the enzyme. The activity of compounds of the invention may be escribed as neuroprotective, cytostatic and antifullammatory. The mechanism of action of compounds of the invention is antisense inhibition of human superoxide dismutase 1 expression by chimeric phosphorothicate coligonucleotides having 2'-methoxyethyl (2'-MoE) wings and a deoxy gap. Compounds of the invention are useful for inhibiting the expression of human superoxide dismutase 1 in human cells or tissues, and for treating a disease or condition associated with this enzyme (antisense therapy), especially amyotrophic lateral sclerosis, a disease or condition arising from aberrant apoptosis and a hyperprollferative disorder. It may also be
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               represent human
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Gaps

Novel antisense compounds targeted to nucleic acids encoding human superoxide dismutase 1, for modulating expression of the dismutase at treating diseases or conditions, e.g. amyotrophic lateral sclerosis.

Claim 3; Page 77; 107pp; English

```
The invention relates to a compound of 8-50 nucleobases in length, targeted to a nucleic acid molecule encoding human superoxide dismutase.

1. The compound specifically hybridises with and inhibits the expression of human superoxide dismutase 1 by hybridising with at least an 8-nucleobase portion of the nucleic acid molecule encoding the active site of the enzyme. The activity of compounds of the invention may be described as neuroprotective, cytostatic and antiinflammatory. The mechanism of action of compounds of the invention is antisense inhibition of human superoxide dismutase 1 expression by chimeric phosphorothicate coligonucleotides having 2-methoxyethy (2-MoE) wings and a deoxy ago.

Compounds of the invention are useful for inhibiting the expression of human superoxide dismutase 1 in human cells or tissues, and for treating a disease or condition associated with this enzyme (antisense therapy), especially amyotrophic lateral selecois; a disease or condition arising from aberiant apoptosis and a hyperproliferative disorder. It may also be used in diagnostics, therapeutics and as a research reagent, e.g.
                                                                                                                                                                                                                                         Human; superoxide dismutase 1; antisense; neuroprotective; cytostatic; antiinflammatory; amyotrophic lateral sclerosis; apoptosis; hyperproliferative disorder; therapy; infection; inflammation; tumour;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Novel antisense compounds targeted to nucleic acids encoding human superoxide dismutase 1, for modulating expression of the dismutase and treating diseases or conditions, e.g. amyotrophic lateral sclerosis.
                                                                                                                                                                                                                                                                                                                                                                                                                                    /mod_base= OTHER

The compound specifically hybridises with and inhibits the expression of human superoxide dismutase 1 by hybridising with at least an 8-nucleobase portion of the nucleic acid molecule encoding the active site
prophylactically to prevent or delay infection, inflammation or tumour formation. Sequences given in records ACC40880-ACC40957 represent human superoxide dismutase 1 antisense inhibitor oligonucleotides
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   /mod_base= OTHER

of the enzyme. The activity of compounds of the invention may be described as neuroprotective, cytostatic and antinflammatory. The mechanism of action of compounds of the invention is antisense inhibition of human superoxide dismutase 1 expression by chimeric phosphorothicate oligonucleotides having 2'-methoxyethyl (2'-MoR) wings and a deoxy gap. Compounds of the invention are useful for inhibiting the expression of human superoxide dismutase 1 in human cells or tissues, and for treating a disease or condition associated with this enzyme (antisense therapy), especially amyotrophic lateral sollerosis, a disease or condition arising from aberrant apoptosis and a hyperproliferative disorder. It may also be used in diagnostics, therapeutics and as a research reagent, e.g. thorphylactically to prevent or delay infection, inflammation or tumour formation. Sequences given in records ACG40880-ACG40897 represent human superoxide dismutase 1 antisense inhibitor oligonucleotides
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           /note= "Phosphorothioate linkages.                                                                                                          The invention relates to a compound of 8-50 nucleobases in length, targeted to a nucleic acid molecule encoding human superoxide dismutase of the compound specifically hybridises with and inhibits the expression of human superoxide dismutase 1 by hybridising with at least an 8-nucleobase portion of the nucleic acid molecule encoding the active site of the enzyme. The activity of compounds of the invention may be mechanism of action of compounds of the invention may be mechanism of action of compounds of the invention is antisense inhibition of human superoxide dismutase 1 expression by chimeric phosphorothicate oligonucleotides having 2'-methoxyethyl (2'-MOE) wings and a deoxy gap. Compounds of the invention are useful for inhibiting the expression of human superoxide dismutase 1 in human cells or tissues, and for treating human superoxide dismutase 1 in human cells or tissues, and for treating
                                                                                                                                                                                                                                                                                                                                             a disease or condition associated with this ensyme (antisense therapy), especially amyotrophic lateral sclerosis, a disease or condition arising from aberrant apoptosis and a hyperproliferative disorder. It may also be used in diagnostics, therapeutics and as a research reagent, e.g.
                                                                                                                                                                                                                                                                                                                                                                                                                            prophylactically to prevent or delay infection, inflammation or tumour formation. Sequences given in records ACC40880-ACC40957 represent human superoxide dismutase 1 antisense inhibitor oligonucleotides

The invention relates to a compound of 8-50 nucleobases in length, targeted to a nucleic acid molecule encoding human superoxide dismutase.

1. The compound specifically hybridises with and inhibits the expression of human superoxide dismutase 1 by hybridising with at least an 8-nucleobase portion of the nucleic acid molecule encoding the active site of the enzyme. The activity of compounds of the invention may be escribed as neuroprotective, cytostatic and antismlammatory. The mechanism of action of compounds of the invention is antisense inhibition of human superoxide dismutase 1 expression by chimeric phosphorothinoate conjugounds of the invention are useful.for inhibiting the expression of human superoxide dismutase 1 in human cells or tissues, and for treating a disease or condition associated with this enzyme (antisense therapy), especially amyotrophic lateral solerosis, a disease or condition arising from aberrant apoptosis and a hyperproliferative disorder. It may also be
                                                                                                                                                                                                                                                                                                                                                                                                                                    used in diagnostics, therapeutics and as a research reagent, e.g. prophylactically to prevent or delay infection, inflammation or tumour formation. Sequences given in records ACC40880-ACC40957 represent human superoxide dismutase 1 antisense inhibitor oligonucleotides

The invention relates to a novel method for enhancing the survival of neurons and/or of cells expressing tyrosine hydroxylase (EC 1.14.16.2 Tyrosine 3-monoxygenase) (TH++). The method comprises contacting a population of cells with Bcl-XI or its functional equivalent, where the comprises a composition of relative the expressing cells or cells capable of differentiating into neurons; or TH expressing cells or cells capable of differentiating into neurons; or TH expressing cells or cells capable of composition of cells obtainable by the method above; a composition of cells obtainable by the method above; a composition of cells obtainable by the method above; a composition of cells obtainable by the method above; a composition of cells obtainable by the method above; a composition of cells obtainable by the method above; a composition of cells obtainable by the method above; a composition of cells obtained by the method above; a lentiviral transfer to protect particle being produced based on a lentiviral transfer vector; enhancing the survival of TH + cells in vivo; a retroviral particle being produced based on a retroviral transfer vector; enhancing the survival of TH + cells in vivo; a retroviral particle in vivo differentiated dopaminergic neurons; a packaging cell line capable of producing an infective vector particle; treatment of a capable of producing an infective vector particle; treatment of a comprising an expression vector comprising a comprising an expression vector comprising a comprising the survival of the fusion protein in a compression of the fusion protein in a compression protein and a promoter companies and a promoter and comprising the expression vector; and producing the capable of the fusion protein in a contract of a comprising the expression vector; and producing the capable of the fusion protein and a promoter or comprising the compression particle; the fusion protein and a produced and a capable of the fusion protein and a capable of the fusion protein and a produced and a capable of t lesioned and traumatic neurons, including traumatic lesions of peripheral nerves, the medulla, the spinal chord, cerebral ischaemic neuronal damage, neuropathy, peripheral neuropathy, Alzheimer's disease, Huntington's disease, Parkinson's disease, amyotrophic lateral sclerosis, or memory impairment connected to dementia. The method is useful for enhancing the survival of neurons and/or of cells expressing tyrosine hydroxylase for the treatment of neurodegenerative disorders. This polynucleotide sequence represents a primer used in the exemplification neuroprotective, nootropic, and antiparkinsonian activities. The cells are useful for transplantation, drug screening, gene profiling, or for the preparation of a medicament useful for the treatment of a CNS disorder is a neurodegenerative disease involving the invention.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          ö
                                                                                                                                                                                                                                                                                                                          Use of acylated glycerols and their nitrogen and sulfur analogs for the prevention and treatment of neurodegenerative disorders, e.g. Parkinson's
                                                                                                                                                                                                                                                                                                                                                                                            The invention relates to the use of acylated glycerols, and their nitrogen and sulfur analogue (I), their optical and geometric isomers, racemates, salts, hydrates, and mixtures, for the prevention and treatment of neurodegenerative disorders. The compounds (I) are used for the prevention and treatment of neurodegenerative diseases such as Parkinson's, Alzheimer's, and plate sclerosis. In an example of the invention, the compounds are tested for their effects on the gene expression of several genes including super-oxide dismutase (SOD), catalase, glutathione peroxidase and other anti-oxidant genes. This sequence corresponds to a PCR primer to amplify the SOD gene for gene

Use of acylated glycerols and their nitrogen and sulfur analogs for the prevention and treatment of neurodegenerative disorders, e.g. Parkinson's disease.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 The invention relates to the use of acylated glycerols, and their nitrogen and sulfur analogue (1), their optical and geometric isomers, racemates, salts, hydrates, and mixtures, for the prevention and treatment of neurodegenerative disorders. The compounds (1) are used for the prevention and treatment of neurodegenerative diseases such as Parkinson's, Alzheimer's, and plate sclerosis. In an example of the invention, the compounds are tested for their effects on the gene expression of several genes including super-oxide dismutase (SOD), catalase, glutathione peroxidase and other anti-oxidant genes. This sequence corresponds to a PCR primer to amplify the SOD gene for gene
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Gaps

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Š
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    ö
                                                                                                                                                                                                                                                                                   The presence of a mutation in a gene encoding a superoxide dismutase (SDD1, SOD2 or SDD3) indicates an increased likelihood of developing a cell death disease, specifically a neurodegenerative disease. The DNA can be analysed to detect mutant SOD sequences. Analysis is pref. preceded by a PCR analysis to pref. preceded by which are useful for diagnosis of diseases linked to SOD1 mutations. (Updated on 25-MAR-2003 to correct PN field.)
                                                                                                                                         Diagnosis, treatment and prevention of diseases of cell death - e.g. amyotrophic lateral sclerosis, which are the result of e.g. decreased SOD
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 AAV73826-V73835 are PCR primers used in the amplification of a novel human SOD1 gene which encodes a Cu/Zn SOD (superoxide dismutase) protein. This protein can be used in a method for treating a neurodegenerative disease particularly familial amyotrophic lateral sclerosis (ALS)

 containing a transgene encoding and expressing a neurodegenerative disease-causing mutant SOD1 polypeptide. The invention also relates to a method of diagnosing an increased likelihood of developing cell death disease in a patient, a kit for the diagnosis of cell death disease in a patient, a method of treating a patient with a disease involving a mutant SOD encoding gene, antibodies reactive with a FALS polypeptide, a method of treating a patient with a neoplasm, a bacterial or yeast cell containing a purified nucleic acid derived from a FALS gene, a purified bNA encoding a purified RALS polypeptide and a purified FALS polypeptide. The SOD1 polypeptide is a mutant or human SOD1 polypeptide. The expression of the mutant polypeptide is under the regulation of the wild-type promoter. This sequence represents a PCR primer used to amplify SOD1 DNA encoding the human cytosolic superoxide dismutase (Cu/ZnSOD)
The invention relates to a transgenic mouse having somatic and germ cells

The present invention provides methods of specifically inhibiting the expression of a mutant allele, while preserving the expression of a co-expression of a co-expression of a co-expressed wild-type allele, using RNA interference (RNA): The methods care useful for treating a subject having a disorder correlated with the presence of a dominant gain of function mutant allele, e.g. amyotrophic lateral sclesosis (ALS), Muntingron's disease, Alzheimer's disease, and parkinson's disease (claimed). Small interfering RNAs (siRNA) and small on the selectively suppress mutant, but not wild-type, expression of copper zinc superoxidase dismutant, but not wind-type, expression of copper zinc superoxidase dismutance (SODI), which causes inherited ALS. In an example from the invention, an allele of SODI in which guanosine 256 (relative to the start of translation) was mutated to cytosine, generating a Gly to Arg (GBSR) mutation, was mutated to cytosine, generating a Gly to Arg (GBSR) mutation, was elected. 2 Sets of 3 siRNAs ADD43041-AD043046 and AD043049 -AD043054, each targeting either wild-type AD043047 or mutant AD043048 SODI mRNA, were designed. The mutated nucleotide was positioned near the predicted site of SODI mRNA cleavage, i.e. position 9 (P9), io (P10) or 11 (P11) relative to the 5' end of the antisense strand of the siRNA PIN sense sequence is the sense strand of wild-type siRNA PI1; the antisense corresponding target RNA, although with different efficiencies. PII was less efficient at cleaving the mRNA than wild-type P9 and P10 siRNAs.
 Inhibiting expression of a target allele in a cell comprising at least two different alleles of a gene, for treating CNS disorders, comprises administering to the cell an siRNA specific for the target allele.
 targeted to wild-type SOD allele (P11).

 The present invention describes a method for preventing or treating diseases associated with a decrease in the expression of AOP-1 gene or AOP-1 comprises: (a) transferring e.g. a mucleic acid encoding AOP-1 gene, or (b) administering a substance enhancing the expression of AOP-1 gene, a substance enhancing production of AOP-1 or a substance enhancing the function of AOP-1. AOP-1 has cardiant, notropic, neuroprotective, antirheumatic, nephrotropic and hepatotropic activities. The method can be used for treating diseases associated with a decrease in the expression of AOP-1 gene or AOP-1, including heart diseases in the eurodedgenerative diseases, rheumatism, kidney diseases and liver diseases. The present sequence represents a probe for Cuân superoxide dismutase (CuZn-SOD), which is used in an example from the present

New nucleic acids, useful for inhibiting the synthesis of a target protein in a enkaryotic cell, or for treating various diseases by inhibiting the expression of abnormal or mutated proteins, e.g. leukemia, viral or bacterial infection.

Disclosure; Page 16; 38pp; English.

The present invention relates to a method for suppressing gene expression in cells, particularly eukaryotic cells. The method involves a new nucleic acid comprising in a 5.43 order: an RNA polymerase promoter sequence, a first target sequence that is essentially complementary to a second target sequence that is essentially complementary to the first target sequence. The sequence that is essentially complementary to the first target sequence, and an RNA polymerase termination signal, where an RNA transcribed from the nucleic acid may form a hairpin structure. The RNA transcribed from the mucleic acid may form a hairpin structure. The polymerase is preferably RNA polymerase III (Pol III) and the polymerase termination signal comprises a number of thymidines are useful for arresting Pol III activity. The nucleic acids and methods are useful for suppressing gene expression in cells, or inhibiting the synthesis of a target protein in a eukaryotic cell or in a cell of a subject. The nucleic acids can be used for treating various diseases by inhibiting the expression of abnormal or mutated proteins, e.g. cancers such as leukaemia, haemophilia, viral or bacterial infections, and chibiting the expression of abnormal Alzheimer's disease, Parkinson's disease, Huntington's disease and amyotrophic lateral sclerosis (ALS). The present sequence represents a target DNA sequence that can be used to inhibit expression of the human superoxide dismutase I (SODI) G28IC (Gly93Ala) mutant gene.

RF M13 clone containing hSOD Cyall1 gene is designated M13rp8SODC111S. The probe is (32)P-labelled. The patent is for a mutein of hSOD in which at least one of the cysteine residues at positions 6 and 111 is replaced with an uncharged AA. DNA encoding the mutein is also claimed. Substin. of the free cysteines of hSOD with uncharged AAs increases thermostability. Cloning and sequencing of hSOD cDNA and the prodn. of hSOD in bacteria and yeast are described in EP-138111. (Updated on 25-MAR-2003 to correct PF field.) (Updated on 25-MAR-2003 to correct PR Field.) (Updated on 25-MAR-2003 to correct PR Field.)

New nucleic acids, useful for inhibiting the synthesis of a target protein in a eukaryotic cell, or for treating various diseases by inhibiting the expression of abnormal or mutated proteins, e.g. leukemia, viral or bacterial infection.

WPI; 2003-852231/79.

Example 6; Fig 5A; 38pp; English.

```
The present invention relates to a method for suppressing gene expression in cells, particularly eukaryotic cells. The method involves a new nucleic acid comprising in a 5'-3' order: an RNA polymerase promoter sequence, a first target sequence that is essentially complementary to a sequence of a target nucleic acid or its complement, a spacer sequence, a second target sequence that is essentially complementary to the first target sequence that is essentially complementary to the first target sequence, and an RNA polymerase termination signal, where an RNA transcribed from the nucleic acid can inhibit expression of the target the polymerase is preferably RNA polymerase in (Pol III) and structure. The polymerase is preferably RNA polymerase III (Pol III) and the polymerase termination signal comprises a number of thymidines are useful for suppressing gene expression in cells, or inhibiting the synthesis of a target protein in a eukaryotic cell or in a cell of a subject. The nucleic acids can be used for treating various diseases by inhibiting the expression of abnormal or mutated proteins, e.g. cancers such as leukaemia, haemophila, viral or bacterial infections, and suppression of abnormal or mutated proteins, e.g. cancers such as leukaemia, haemophila, viral or bacterial infections, and suppression of abnormal or mutated proteins, e.g. cancers such as leukaemia, haemophila, viral or bacterial infections, and suppression of abnormal or mutated proteins, e.g. cancers and proteins are severed to the protein or a context of proteins and methods ö

The claimed Cu-Zn SOD structural gene may be a cDNA derived from mRNA sepd. from normal human tissues or a synthetic gene for the same AA SO in which the codons for some AAs are replaced by codons which are frequently used in a host organism. The regulatory gene of the colicin E1 gene in the present invention contains the base sequence from No. 143 to No.359 in AAN60182 as an essential segment. (Updated on 25-MAR-2003 to correct PA field.)

The present invention describes an amyotrophic lateral sclerosis (ALS) model rat. Also described: (1) a transgenic rat or its progeny having a DNA with integrated exogenic variant \mathrm{CU/Zn} superoxide dismutase (SOD) gene; and (2) rat embryonic stem cells having human variant \mathrm{CU/Zn} SOD gene sequence. The transgenic rat can be used in the investigation of the pathology and the onset mechanism of ALS. The present sequence represents a PCR primer which is used in an example from the present invention

New oligonuclectide primers amplifying gene regions conserved among mammals - useful for developing genomic maps, isolating clones and making cross-species comparisons.

Claim 2; Page 13; 26pp; English.

The present sequence represents a specifically claimed oligonucleotide PCR primer. The oligonucleotide can be used for polymerase chain reaction (PCR) amplification of DNA, specifically regions of specific genes that are conserved among mammalian species, i.e. pairs of oligonucleotides from the present specification represent universal mammalian sequenceraged site (UM-STS) primers. The primers are used to develop genomic maps, to isolate clones from libraries, to make cross-species comparisons and to develop additional genetic markers. UM-STS allow genomic comparisons to be made between more species

The invention relates to a novel method and a DNA chip for monitoring a response of cancer patients to irradiation therapy using antioxidant gene expression analysis. Thereby accurately anticipating the response to irradiation therapy and minimizing adverse side-effects thereof. A method for monitoring a response of cancer patients to irradiation therapy comprises: collecting a peripheral blood cell from a human; irradiating the peripheral blood cell; extracting RNA according to the time period; preparing DNA from the RNA; hybridizing the DNA with antioxidant enzyme cDNA; amplifying the hybridized DNA using one or more pairs of primers selected from: DNA fragments of ADT66491 and ADT66492; DNA fragments of ADT66492 and ADT66493 and ADT66493 and ADT66499; and analyzing expression pattern of the amplified DNA according to the time period. ADT66496; and DNA fragments of ADT66499; and analyzing expression pattern of the amplified DNA according to the time period. DNA chip for monitoring a response of cancer patients to irradiation therapy amplifies one or more antioxidant genes corresponding to the following DNA fragments of ADT66490 - gamma-GCS; DNA fragments of ADT66480 and ADT66480 - GNA COLLOwing DNA fragments of ADT66490 - GNA ADT
 ADT66491 and ADT66492 - catalase; DNA fragments of ADT66493 and ADT66494 - Cura SOD; DNA fragments of ADT66495 and ADT66496 - Mn SOD; and DNA fragments of ADT66498 - Prx II. The present sequence represents a PCR primer of the invention.

The present invention relates to a method for suppressing gene expression in cells, particularly eukaryotic cells. The method involves a new nucleic acid comprising in a 5-3' order: an RNA polymerase promoter agequence, a first target sequence that is essentially complementary to a sequence of a target nucleic acid or its complement, a spacer sequence, a sequence that is essentially complementary to the first target sequence that is essentially complementary to the first target sequence, and an RNA polymerase termination signal, where an RNA transcribed from the nucleic acid can inhibit expression of the target gene. The RNA transcribed from the nucleic acid may form a hairpin of structure. The polymerase is preferably RNA polymerase III [Pol III) and the polymerase termination signal comprises a number of thymidines sufficient for arresting Pol III activity. The nucleic acids and methods sufficient for suppressing spee expression in cells, or inhibiting the synthesis of a target protein in a eukaryotic cell or in a cell of a subject. The nucleic acids can be used for treating various diseases by used to inhibiting the expression of abnormal or mutated proteins, e.g. cancers such as leukaemia, haemophilia, viral or bacterial infections, and neurodegenerative diseases including Alzheimer's disease, Parkinson's disease. Huntington's disease and amyotrophic lateral sclerosis (ALS). The present sequence represents a target DNA sequence that can be used inhibit expression of the human superoxide dismutase 1 (SODI) G256C Gly85Arg) mutant gene.

The invention relates to a novel pharmaceutical composition, which has a first active agent comprising an oligomicleotide antisense to the initiation codon, coding region, 5' or 3' end genomic flanking regions, 5' and 3' intron-exon junctions, or regions within 2-10 nucleotides of junctions of genes encoding a polypeptide associated with lung and/or nasal airway dysfunction and a second active agent comprising an antiinflammatory steroid and ubiquinone. A composition of the invention has antiinflammatory teroid and ubiquinone. A composition of the invention has antiinflammatory transportic, antiasthmatic, hypotensive, immunosuppressive, and cytostatic activity. The composition may have a cuse in antisense gene therapy. The composition is useful for treating or preventing a respiratory, lung or malignant disease or condition, also for enhancing the prophylactic or therapeutic respiratory effect of an antiinflammatory steroid in a subject, for reducing or depleting levels of continuous or creeptor, producing bronchodilation, increasing levels of adenosine receptor, producing bronchodilation, increasing levels of updinione or lung surfactant in a subject's tissue, or treating bronchoorsoristication, lung allergies, or a respiratory disease or condition. Note: The sequence data for this patent is not represented in the printed or per feature of the condition. ö Pharmaceutical composition for treating ailments associated with impaired respiration, has oligo(s) antisense to specific gene(s) or its corresponding RNAs, and glucocorticoid or non-glucocorticoid steroid or adenosine receptor; bronchodilation; bronchoconstriction; lung allergy; Gaps Aguilar D; .; 0 2.0%; Score 17.4; DB 1; Length 20; 94.7%; Pred. Pharmaceutical composition for treating asthma, has antisense oligonuclectide containing less percentage of adenosine, targeted tnucleic acids associated with lung airway or lung dysfunction, and bronchodilating agent.

Claim 15; SEQ ID NO 7135; 763pp; English

This invention describes a novel composition (a) a first active agent, comprising oligonucleotides, effective for alleviating comprising oligonucleotides, effective for alleviating comprising oligonucleotides, effective for alleviating cadenosine sensitivity, levels of adenosine (A) or (A) receptors, caurfactant depletion or hyposecretion, when administered to a mammal. The oligonucleotides are derived from a gene encoding or regulating expression of a target polypeptide associated with lung airway or lung dysfunction also describes a kit, that comprises: (a) a delivery device, in separate containers, (b) the oligonucleotides, (c) instructions for adding a carrier and for use of the kit. The composition of the invention has antiallergic, antiinflammatory, antiasthmatic, analgesic, hypotensive, immunosuppressive and cytostatic activity, is a composition composition composition composition composition are administered composition composition and of the carrier and for use of the kit. The composition of a useful for preventing or treating a respiratory, lung or malignant disease. The administered composition comprises oligo and is administered to reduce the production or availability, or to increase the degradation of the target many or reduce the amount of target polypeptide present in the lungs. The reduce the amount of target polypeptide present in the lungs. The inflammation, allergies and/or surfactant hypoproduction are associated with a disease or condition such as pulmonary vasoconstriction, content of inflammation, allergies, asthma, impeded respiration, respiratory distress syndrome, pain, cystic fibrosis, allergies orresponding to transplantation rejection, pulmonary infections, bronchitis or cancer. The reduced adenosine content of the anti-sense oligonacleotides into products that free adenosine into the system of the anily and the present in the target RNA serves to prevent the breakdown of the anilyment and the same of the product of the anilyment and the system of the anilyment and the system of th prevent any unwanted effects due to it

Hall J; Guida M, WPI; 2002-698522/75.

Isolated nucleic acid molecules having polymorphisms in known human genes e.g. cytochrome p450 and cathepsin S useful as genetic linkage markers for locating, identifying and characterizing the genes responsible for disorder-related traits.

Example 22; Page 144; 714pp; English.

This invention relates to the sequence of an isolated nucleic acid
molecule comprising at least one base variation from that of a known
human cytcohrome P450 Al (CYP4501A1), CYPCOhrome P450 A2 (CYP4501A2),
cytcochrome P450 02E1 (CYP4501A1), CYPCOhrome P450 A2 (CYP4501A2),
cytcochrome P450 02E1 (CYP45002E1), adrenatic receptor betal (ADBR1),
aryl hydrocarbon (AHR), aryl hydrocarbon receptor nuclear translocator
(ARNY), cathegain S (CYES), cyclooxogenase 2 (COX2), diazepam binding
inhibitor (DBI), epoxide hydroxylase 2 (EPHX2), 5-lipoxygenase activating
protein (FLAP), glutathione-S-transferase 12 (GST12), histamine-N-methyl
transferase (HNMY), (ABIlikrein 2) KLK2, nicotinamide -N-methyl
transferase (HNMY), (ABILIkrein 2) KLK2, nicotinamide -N-methyl
transferase (HNMY), NADPH quinone oxidoreductase 2 (NQC2),
culfortansferase thermolabile (STM), UDP-glucuronosyl transferase 2B4
(UGT2B1), UDP-glucuronosyl transferase 2B7 (UGT2B7), UDP-glucuronosyl
transferase (UGT2B15), urokinase receptor (UPA), multidrug resistance
transferase (UGT2B15), urokinase receptor (UPA), multidrug resistance
(WRP3), orphan nuclear receptor (NR112), or acetylcholine muscarinic
receptor 1, 2, 3, 4, or 5 (CHWR1, CHWR2, CHWR3, CHWR3) sequence
The polymorphisms in the human genes cited in the invention are useful as responsible for specific traits within the genome and eventually
clantifying the genes responsible for a variety of disorder-related
traits as a result of their e.g., overexpression, constitutive
cypression, mutation or underexpression, which may be used in diagnosing
cand/or treating the disorders. The nucleic acid molecules comprising the
polymorphic sequences contained in CYP4501A1, CYP4501A2, CYP4502E1,

```
ARNT, EPHX2, GST12, NNWT, NQO2, NR112, STW, UGT2B4, UGT2B17, UGT2B15, AHR, MDR1 and/or MDR3 are useful for screening individuals for altered drug metabolism. The polymorphic sequences contrained in CYP4501A1, CYPP4501A2, AHR. MDR1 and/or MDR3 may also be used to screen individuals for susceptibility to cancer. Polymorphic sequences in ADRB1 or CHWR2 are used to screen for altered cardiovascular function, in COX2 for altered susceptibility to colorectal tumours, in DBI or CHWR1 for altered central nervous system function, in FLAP and HNWT for altered pulmonary, immunological or haematological function, in KHR2 for altered serine protease activity in the prostate, in LFF for altered immunological function, in CHWR3, CHWR4 or CHWR5 for altered central haematological function, in CHWR4 or CHWR5 for altered central and peripheral nervous system function. The present invention describes a method for preventing or treating diseases associated with a decrease in the expression of AOP-1 gene or AOP-1 comprises: (a) transferring e.g. a nucleic acid encoding AOP-1 gene; or (b) administering a substance enhancing the expression of AOP-1 gene, a substance enhancing production of AOP-1 or a substance enhancing the function of AOP-1. AOP-1 has cardiant, noctropic, neuroprotective, antirheumatic, nephrotropic and hepatotropic activities. The method can be used for treating diseases associated with a decrease in the expression of AOP-1 gene or AOP-1, including heart diseases in the expression of AOP-1 gene or AOP-1, including heart diseases in the diseases. The present sequence represents a PCR primer for CuZn superoxide dismutase (CuZn-SOD), which is used in an example from the
 Diagnosis, treatment and prevention of diseases of cell death - e.g. amyotrophic lateral sclerosis, which are the result of e.g. decreased SOD

 The present sequence is a primer for the PCR amplification of exon 4 of the murine SOD-1 gene, which was used to distinguish SOD deficient mice that have lost both or loopy of the SOD-1 gene. The SOD-1 deficient mice were used in the preparation of mice homozygous or heterozygous for a targeted amyloid precursor protein (APP) encoding gene, comprising a human Abete peptide encoding sequence in place of the endogenous murine sequence, and at least 1 Swedish Familial Alzheimer's Disease (FAD) mutation. The mice can be used as tools, or models to elucidate the role of human Abeta in AD pathology and symptomatology. They can also be used to screen chemical compounds for the ability to inhibit in vivo processing of APP, to yield the human Abeta peptide by administering the chemical compounds and measuring the relative amounts of mouse and monamyloidogenic processing of APP in a sample from mouse at an appropriate interval after administration of the chemical
 Transgenic mice with humanised amyloid precursor protein gene - having at least 1 Swedish FAD mutation, useful as tools or models to elucidate role of human A-beta in Alzheimer's disease.

The invention relates to novel compounds of 8-80 nucleobases in length targeted to, and which specifically hybridises with, a nucleic acid molecule encoding 3-hydroxy-3-methylglutearyl-Coenzyme A (HMG-CoA) reductase, and inhibits the expression of HMG-CoA reductase. The novel compounds have cardiant, antiarteriosclerotic, and antilipaemic activities. The compound can be used to treat disorders by antisense gene therapy. The compounds compositions and methods are useful for treating a disease or condition associated with HMG-CoA reductase, such as a cardiovascular disorder e.g. atherosclerosis, or a disease or condition involving cholesterol metabolism. They are also useful in research and diagnostics for modulating the expression of HMG-CoA reductase. This polynucleotide sequence represents an antisense oligonucleotide of the

targeted to, and which specifically hybridises with, a nucleic acid molecule encoding 3-hydroxy-3-methylgluaryl-Coenzyme A (HMG-COA) reductase, and inhibits the expression of HMG-COA reductase. The novel compounds have cardiant, antiarteriosclerotic, and antilipaemic activities. The compound can be used to treat disorders by antisense gene therapy. The compounds compositions and methods are useful for treating a disease or condition associated with HMG-COA reductase, such as a cardiovascular disorder e.g. atherosclerosis, or a disease or condition involving cholesterol metabolism. They are also useful in research and disagnostics for modulating the expression of HMG-COA reductase. This polymucleotide sequence represents an antisense oligonucleotide of the

The present invention provides nucleotides encoding molecular variants of identify compounds capital (MDR-1) protein. These can be used to identify compounds capable of treating multidrug resistance and sensitivity interfering resulting from polymorphisms in MDR-1, which can lead to difficulties in treating cancer, cardiovascular, neuronal, inflammatory and CNS diseases
 New polynucleotide encoding a molecular variant Multi Drug Resistance (MDR)-1 polypeptide is useful for diagnosing and treating diseases associated with abnormal MDR-1 expression or function, e.g. cancer.

New isolated nucleic acid, useful for treating viral diseases associated with tumors and cell degeneration, also related polypeptides, antibodies and transfected cells. WPI; 2003-313354/30.

Disclosure; SEQ ID NO 3311; 30pp; French.

This invention relates to novel isolated nucleic acid sequences involved in the phenomena of tumour suppression, tumour reversion, apoptosis and/or resistance to viruses. The invention may be useful for the development of compounds with a cytostatic, virucide, neuroprotective, nootropic or neuroleptic activity. The DNA sequences may be useful as probes and primers for detecting, indentifying, quantifying and/or amplifying nucleic acid, for example as one component of a gene chip, in vitro as antisense reagents and for production of recombinant

polypeptides. The invention may therefore be useful for preparation of pharmaceuticals for prevention and/or treatment of viral diseases that are characterised by development of tumours or cell degeneration, specifically cancer but also Alzheimer's disease and schizophrenia. The present sequence is that of a nucleic acid sequence of the invention. Note: The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format directly from WIPO at ftp.wipo.int/pub/publishedpct\_sequences 8888888888888

 The invention relates to a set of novel map-related biallelic markers, preferably located on obesity disorder-associated chromosomal regions on chromosomes 3, 10 and 19. The markers are useful for genotyping or estimating the frequency of an allele in a population, for detecting an association between a genotype or haplotype and a phenotype, e.g. a disease involving drug responses, obesity or disorders related to obesity, such as hyperinicaemia, dispestive pathology, hepatic function disorders, cancer, cardiovascular disease, hypertension, hyperlipidaemia, insulin disorders, atheromatous disease and cardiac insufficiency. The markers are useful for detecting a statistical correlation between a biallelic marker allele and a phenotype and/or between a biallelic marker haplotype and a phenotype. This sequence represents a PCR primer used to amplify a human obesity-associated biallelic marker

derivative for the preparation of a pharmaceutical composition for treating colorectal, cervical, gastric, lung, ovarian or pancreatic cancer, or malignant glioma in a subject having a genome with a variant allele which comprises a cytcchrome p450, subfamily IIIA (nifedipine oxidase), polypeptide 5 (CYPRAS) polymucleotide (II). (I) and (II) have cytostatic activity. The therapeutic applications of (I) is improved, since it is possible to individually treat a subject with an appropriate derivative of (I). Therefore, undesirable, harmful or toxic effects are efficiently avoided. Unnecessary and potentially harmful treatment of those subjects who do not respond to the treatment with substances (nonresponders), as well as the development of drug resistances due to suboptimal drug dosing can be avoided. ACF62200 to ACF62751 and ABM34912 to ABM35013 represent sequences used in the exemplification of the present invention
 New use of irinotecan for preparation of compositions for treating cance in subject having genome with variant allele comprising cytochrome p450, subfamily IIIA, polypeptide 5 polynucleotide, termed CYP3A5.
 Use of irinotecan or its derivative for preparation of a pharmaceutical composition for treating cancer in a subject having a genome with a variant allele comprising a multidrug resistance protein 1 polynucleotide.

The present invention describes a method for the use of irinotecan (I) or tist derivative for the preparation of a pharmaceutical composition for treating colorectal, cervical, gastric, lung, ovarian or pancreatic cancer, or malignant glioma in a subject having a genome with a variant allele which comprises a multidrug resistance protein I (MRP1) golynucleotide (II). (I) has cytostatic activity. (I) or its derivative can be used for the preparation of a pharmaceutical composition for treating colorectal, cervical, gastric, lung, ovarian or pancreatic cancer, or malignant glioma in a subject, where the subject is a human (preferably African or Asian) or a mouse. The present sequence represents a sequence which is used in the exemplification of the present invention.
 Use of irinotecan to treat cancer patient by determining if patient has variant alleles of UGT1A1 gene, administering increased/decreased amounts of irinotecan based on increased/decreased levels of UGT1A1 gene product.
 The invention relates to the novel use of irinotecan to treat a patient suffering from cancer. This involves determining if the patient has one or more variant alleles of the UGTAH gene, and if the patient has one or more of such variant alleles, irinotecan is administered in an increased or decreased amount in comparison to the amount that is administered has cytostatic activity. A composition of the invention acts as a topolsoomerase I inhibitor. The method is useful for treating a patient, an animal e.g. mouse or a human, preferably African or Asian, suffering from cancer such as colorectal, cervical, gastric cancer, lung, ovarian, pancreatic cancer or malignant glioma. The present sequence is udes in the exemplification of the invention.

MUCH LINEXTME that cleaves mutant polynucleotides, useful in treating a dominantly inherited disorder associated with a mutant allele, such as achondroplasia, amyotrophic lateral sclerosis, Marfan syndrome and hypercholesterolemia.

The specification describes a DNAzyme which selectively cleaves a mutant polynucleotide by cleaving at a site remote from the mutation site. The polynucleotide by cleaving at a site remote from the mutation site. The DNAzyme binds selectively to a mutant allele or its expressed product, and comprises a central catalytic motif (Helix II) and two flanking regions has a polynucleotide sequence complementary to a region that includes the mutation in the mutant allele or to that of the expressed product. Both flanking regions are complementary to mutated regions of the mutant of allele or the expressed product. The complement of the mutation is 2 or 3 nucleotides upstream or downstream of the site of cleavage, preferably in helix I helix I and III are of different lengths, where helix I is shorter than helix III, and their length is 2-7 or 15-8 nucleotides. Helix I preferably comprises 9 nucleotides and helix III and their lengths of the comprises of the flanking regions comprises ribonucleic acid. The DNAzyme further comprises a stem-loop structure at either or both terminus. The DNAzyme is useful in therapy, in particular for the cerminus. The DNAzyme is useful in therapy, in particular for the mutant allele in a patient, where the DNAzyme comprises a central catalytic motif and two flanking substrate-binding regions, and where at least one flanking region binds at the site of mutation in the mutant cannot be substrated be medicated is a disorder associated removed from the site of mutation. The disorder is a dominantly inherited removed the substrate is a dominantly inherited removed the substrate is a dominantly inherited removed the such as advention and substrate is a dominantly inherited removed the such as advention and substrate is a dominantly inherited removed the such as advention and substrate is a dominantly inherited alsorder, such as advention lands at all such an advention and such as all such as advention of the such as advention and such as adventions. fragments, respectively, of the Cu/Zn superoxide disutase (SOD-1) gene where a G12R mutation occurs, and causes amyotrophic lateral sclerosis. New DNAzyme that cleaves mutant polynucleotides, useful in treating a dominantly inherited disorder associated with a mutant allele, such as achondroplasia, amyotrophic lateral sclerosis, Marfan syndrome and hypercholesterolemia.

Disclosure; Page 8; 24pp; English.

The specification describes a DNAzyme which selectively cleaves a mutant polynucleotide by cleaving at a site remote from the mutation site. The polynucleotide by cleaving at a site remote from the mutation site. The MNAzyme binds selectively to a mutant allele or its expressed product, and comprises a central catalytic motif (Helix II) and two flanking captons (helix I and III) where at least one of the flanking regions has contained a polynucleotide sequence complementary to a region that includes the mutation in the mutant allele or that of the expressed product. The complement of the mutant both capters of product. The complement of the mutant is 2 or 3 uncleotides upstream or downstream of the site of cleavage, preferably in chelix I. Helix I and III are of different lengths, where helix I is shorter than helix III, and their length is 21-7 or 15-8 nucleotides. Helix I preferably comprises 9 nucleotides and helix III 13 nucleotides. At least one of the flanking regions comprises and helix III 13 nucleotides. At least one of the flanking regions comprises ribonucleic acid. The camparature of a medicament for the treatment of a disorder associated catalytic motif and two flanking substrate-blinding regions, and where at cleast one flanking region binds at the site of mutation in the mutant capture at length comprises a central catalytic motif and two flanking substrate-blinding regions, and where at length comprises a central catalytic motif cleaves at a site remote from the site of mutation. The disorder, such as adondroplasia, ampotrophic lateral sclerosis with suntain mutant purporance. The site of mutation in the mutant purporance and mutant and the catalytic motif cleaves at a site remote from the site of mutation, marganes in mperfect and mutant purporance. Marganes and mutant and the catalytic motif as adondroplasia, and public lateral solerosis with some where a Lies mutation occurs, and causes amyotrophic lateral sclerosis. These sequences are suitable for the design of DNAzymes of the invention ragments, respectively, of the Cu/Zn superoxide disutase (SOD-1) gene represent the wild type and mutant DNA SCCMS. This invention describes a novel method for genotyping the human MDR-1 (multidrug resistance-1) gene by mass spectrometric detection of the mutational status at some or all of 16 point mutations (single nucleotide polymorphism; SNRS). Genotyping the MDR-1 gene may indicate altered transport of compounds, including drugs, across cell membranes), and thus may indicate that changes in drug dosage are required. The method is rapid, valid and inexpensive, and provides a high throughput screen with only a few genotypic characteristics expected. Particularly mass analysis takes only 4 seconds, so a four-fold multiplex reaction will allow all positions to be determined in about 16 sec

The invention relates to a novel isolated 17 mer nucleic acid sequence, given in the specification, a sequence containing at least 15 consecutive nucleotides from the 17 mer sequence, a sequence with, after optimal alignment at least 80 % identity to the 17 mer sequence that containing at least 15 consecutive alignment at least 80 % identity to the 17 mer sequence, a sequence that hybridizes to them under highly stringent conditions, or the complement of any of them, or the corresponding RNA. The novel isolated nucleic carles of the invention are useful as probes and primers for detecting, additionally quantifying and/or amplifying a nucleic acid, e.g. as one component of a gene chip, in vitro as (anti) sense reagents, and for production of recombinant polypeptides. Any of the nucleic acids, concornent of recombinant polypeptides are useful for polypeptides, vectors containing the nucleic acids, cells containing the nucleic acids, cells containing the cetor or antibodies directed against the polypeptides are useful for diseases that are characterised by development of tumours or cell diseases that are characterised by development of tumours or cell scharacterised by harmore but also Alzheimer's disease and scharachernian Analysis of the expression of the 17 mer nucleic acids in patient samples is useful for dispensions and/or prognosis of these diseases. The polypeptides can also be used to generate antibodies, and

The present invention describes the use of irinotecan (I) or its derivative for the preparation of a pharmaceutical composition for treating colorectal, cervical gastric, lung, ovarian or pancreatic cancer, or malignant glioma in a subject having a ganome with a variant allele which comprises a cytochrome p450, subfamily IIIA (nifedipine coxidase), polypeptide 5 (CYPSAS) polynucleotide (II). (I) and (II) have cytostatic activity. The therapeutic applications of (I) is improved, since it is possible to individually treat a subject with an appropriate derivative of (I). Therefore, undesirable, harmful treatment of those subjects who do not respond to the cotentially harmful treatment of those subjects who do not respond to the treatment with substances (nonresponders), as well as the development of drug resistances due to suboptimal drug dosing can be avoided. ACF62200 co ACF62751 and ABM34912 to ABM35013 represent sequences used in the

 Use of irinotecan to treat cancer patient by determining if patient has variant alleles of UGT1A1 gene, administering increased/decreased amounts of irinotecan based on increased/decreased levels of UGT1A1 gene product.
 The invention relates to the novel use of irinotecan to treat a patient suffering from cancer. This involves determining if the patient has one or more variant alleles of the UGTIAl gene, and if the patient has one or more of such variant alleles, irinotecan is administered in an increased or decreased amount in comparison to the amount that is administered without regard to the patient's alleles in the UGTIAl gene. The invention has cytostatic activity. A composition of the invention acts as a topoisonmerase I inhibitor. The method is useful for treating a patient, an animal e.g. mouse or a human, preferably Arrican or Asian, suffering from cancer such as colorectal, cervical, gastric cancer, lung, ovarian, pancreatic cancer or malignant gliona. The present sequence is udes in the exemplification of the invention.
 irinotecan; colorectal cancer; cervical cancer; gastric cancer; lung cancer; ovarian cancer; pancreatic cancer; malignant glioma; multidrug resistance 1; MDR1; cytostatic; human; ds; Cyp3A5; MRP1; MDR1;

The invention relates to a nucleic acid molecule which down regulates expression of a CD20 gene and a nucleic acid molecule which down corresponded to a CD20 gene and a nucleic acid molecule which down corregulates expression of a neurite growth inhibitor gene (NGOD). The nucleic acids may be enzymatic nucleic acids (e.g. a ribozyme or a nucleic acids may be enzymatic nucleic acid cleaving an RNA molecule DNAzyme) an Inozyme (an endolytic nucleic acid cleaving an RNA molecule consensing an NCH motif), a G-cleaver (cleaving RNA with a VGY motif). The CD20-targetting nucleic acid is used to cleave RNA of CD20 in the presence of a divalent cation that is preferably Mg^2+. Furthermore, it may be contacted with a cell to reduce CD20 activity of the cell and treat a patient having a condition associated with the level of CD20. The treatment may further comprise the use of one or more therapies. In particular, the CD20 targetting nucleic acid may be used to treat lymphoma, leukaemia, B-cell lymphoma, low-grade or follicular non-Hodgkin's lymphoma (NHL), bulky low-grade or follicular NHL, lymphoma, leukaemia, HV (human immunodeficiency virus) associated NHL, lymphoma, contacted with a cell to reduce NOGO gene in the manume thrombocytopaenia, and inflammatory arthropathy. The NOGO contacted may be contacted with a cell to reduce NOGO activity of the condition and treat a patient having a condition associated with the level of the NOGO. The treatment may further comprise the use of one or more condition and treat a patient having a condition associated with the level of NOGO. The treatment may further comprise the use of one or more condition as system (CNS) injury and cerebrovascular accident (CNA, stroke), Alzhaimer's disease, dementia, multiple sclerosis (MLS), chemotherapy-induced neuropathy, amy/orropinic lateral sclerosis (MLS), chemotherapy-induced neuropathy, amy/orropinic acide so created to the modiles on a modiles on the parager.
 Nucleic acid molecules, e.g., enzymatic nucleic acids and antisense constructs, which down regulate expression of a CD20 gene or neurite growth inhibitor gene useful for treating, e.g., lymphoma, leukemia, and
 the modulation of NOGO expression. The present

New isolated nucleic acid, useful for treating viral diseases associated with tumors and cell degeneration, also related polypeptides, antibodies and transfected cells.

Disclosure; Page 436; 720pp; French.

The invention relates to a novel isolated 17 mer nucleic acid sequence, given in the specification, a sequence containing at least 15 consecutive nucleotides from the 17 mer sequence, a sequence with, after optimal alignment, at least 80 % identify to the 17 mer sequence that the corresponding RNA. The novel isolated nucleic of any of them, or the corresponding RNA. The novel isolated nucleic caids of the invention are useful as probes and primers for detecting, dentifying and/or amplifying a nucleic acid, e.g. as one caids of the invention are useful as probes and primers for detecting, caching the component of a gene chip, in vitro as (anti) sense reagents, and for production of recombinant polypeptides. Any of the mucleic acids, or production of recombinant polypeptides. Any of the mucleic acids, polypeptides, vectors containing the nucleic acids, cells containing the cortor or antibodies directed against the polypeptides are useful for preparation of pharmaceuticals for prevention and/or treatment of viral diseases that are characterised by development of tumours or cell diseases that are characterised by development of tumours or cell cases that are characterised by development of tumours or cell cases that are hanlypists of the expression of the 17 mer nucleic acids in patient samples is useful for diagnosis and/or prognosis of these chips. The polypeptide sequences of the invention can be used in gene chips. The nucleic acid sequence represents a tumour suppression character altered human fukutin oligonucleotide of the invention.

New isolated nucleic acid, useful for treating viral diseases associated with tumors and cell degeneration, also related polypeptides, antibodies and transfected cells.

Tuijnder M;

Telerman A, Amson R, WPI; 2003-313353/30.

(MOLE-) MOLECULAR ENGINES LAB 17-SEP-2001; 2001FR-00011978.

Disclosure; Page 659; 720pp; French.

The interior features to a move, isolated 1, mer muches and sequence, a sequence with, after optimal nucleotides from the 17 mer sequence, a sequence with, after optimal algorem in the specification, or the 17 mer sequence, a sequence that the algorement is a sequence that the algorement is to the munder highly stringent conditions, or the complement of any of them, or the corresponding RNA. The novel isolated nucleic acids of the invention are useful as probes and primers for detecting, identifying and/or amplifying a nucleic acid, e.g. as one component of a gene chip, in vitro as (anti) sense reagents, and for production of recombinant polypeptides. Any of the nucleic acids, or polypeptides, vectors containing the nucleic acids, calls containing the vector or antibodies directed against the polypeptides are useful for preparation of pharmaceuticals for prevention and/or treatment of viral diseases that are characterised by development of tumours or cell corpusation, specifically cancer but also Albreimer's disease and schizophrenia. Analysis of the expression of the in uncleic acids in patient samples is useful for diagnosis and/or prognosis of these diseases. The polypeptides can also be used to generate antibodies, and both the polypeptide and antibodies are useful as components of protein chips, The nucleic acid sequences of the invention can be used in gene therapy. This polynucleoride sequence represents a tumour suppression related human fukutin oligonucleotide of the invention The invention relates to a novel isolated 17 mer nucleic acid sequence

 New use of irinotecan for preparation of compositions for treating cancer in subject having genome with variant allele comprising cytochrome p450, subfamily IIIA, polypeptide 5 polynucleotide, termed CYP3A5.
 treating colorectal, cervical, gastric, lung, ovarian or pancreatic cancer, or malignant glioma in a subject having a genome with a variant allele which comprises a cytchrome p450, subfamily IIIA (nifedipline oxidase), polypeptide 5 (CYPASS) polymucleotide (II). (I) and (II) have cytostatic activity. The therapeutic applications of (I) is improved, since it is possible to individually treat a subject with an appropriate derivative of (I). Therefore, undesirable, harmful or toxic effects are efficiently avoided. Unnecessary and potentially harmful treatment of those subjects who do not respond to the treatment with substances (nonresponders), as well as the development of drug resistances due to suboptimal drug dosing can be avoided. ACF62200 to ACF62751 and ABM34312 to ABM35013 represent sequences used in the exemplification of the present invention

The invention relates to the novel use of irinotecan to treat a patient suffering from cancer. This involves determining if the patient has one or more variant alleles of the UGTAAL gene, and if the patient has one or more of such variant alleles, irinotecan is administered in a increased or decreased amount in comparison to the amount that is administered without regard to the patient's alleles in the UGTAAL gene. The invention has cytostatic activity. A composition of the invention acts as an etopoisomerase I inhibitor. The method is useful for treating a patient, an animal e.g. mouse or a human, preferably African or Asian, suffering from cancer such as colorectal, cervical, gastric cancer, lung, ovarian, pancreatic cancer or malignant gliona. The present sequence is udes in the exemplification of the invention.
 Use of irinotecan to treat cancer patient by determining if patient has variant alleles of UGTIA1 gene, administering increased/decreased amounts of irinotecan based on increased/decreased levels of UGTIA1 gene product.
 Use of irinotecan to treat cancer patient by determining if patient has variant alleles of UGTIA1 gene, administering increased/decreased amounts of irinotecan based on increased/decreased levels of UGTIA1 gene product.

New isolated nucleic acid, useful for treating viral diseases associated with tumors and cell degeneration, also related polypeptides, antibodies and transfected cells.

Disclosure; SEQ ID NO 765; 30pp; French.

This invention relates to novel isolated nucleic acid sequences involved in the phenomena of tumour suppression, tumour reversion, apoptosis and/or resistance to viruses. The invention may be useful for the development of compounds with a cytostatic, virucide, neuroprotective,

nootropic or neuroleptic activity. The DNA sequences may be useful as probes and primers for detecting, indentifying, quantifying and/or amplifying nucleic acid, for example as one component of a gene chip, in vitro as antisense reagents and for production of recombinant polypeptides. The invention may therefore be useful for preparation of phramacouticals for prevention and/or treatment of viral diseases that are characterised by development of tumours or cell degeneration, specifically cancer but also Alzheimer's disease and schizophrenia. The present sequence is that of a nucleic acid sequence of the invention. Note: The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format directly from WIDO at fip.wipo.int/pub/publishedpct\_sequences 2502555555555555

WPI; 2003-248179/24.

Inhibiting DNA replication or cell proliferation, useful for treating tumors, comprises contacting a DNA molecule with a nucleic acid antigene that specifically hybridizes to a portion of the DNA molecule having dyad symmetry.

Claim 11; Page 16; 54pp; English.

The invention relates to inhibiting DNA replication and involves contacting a DNA molecule with a nucleic acid antigene comprising at least 12 nucleobases selected from natural nucleobases, modified nucleobases, and their mixture. The antigene specifically hybridizes to a portion of the DNA molecule having dyad symmetry. The method is useful in inhibiting DNA replication and, thus, inhibiting the growth of bacteria, virus (e.g. HIV), fungi, protozoa, helminths and insects. The method is also useful in inhibiting cell proliferation of tumour cells. The present sequence represents an antigene inhibiting the cruciform formation of mammalian replication origin

Nucleic acid molecules, e.g., enzymatic nucleic acids and antisense constructs, which down regulate expression of a CD20 gene or neurite growth inhibitor gene useful for treating, e.g., lymphoma, leukemia, and central nervous system injury.

Claim 88; Page 101; 200pp; English

ដ

The invention relates to a nucleic acid molecule which down regulates expression of a cD20 gene and a nucleic acid molecule which down regulates expression of a neurite growth inhibitor gene (NOGO). The cregulates expression of a neurite growth inhibitor gene (NOGO). The nucleic acids may be enzymatic nucleic acids (e.g. a ribozyme or a nucleic acids may be enzymatic nucleic acid cleaving RNA with a NVN motif), a G-cleaver (Cleaving RNA with a NVN motif), a G-cleaver (Cleaving RNA with a NVN motif), a divalent cation that is preferably Mg^2+.

The DY mich a YGY motif). The CD20-targeting nucleic acid is used to cleave RNA of CD20 in the presence of a divalent cation that is preferably Mg^2+.

The relation of a divalent cation that is preferably Mg^2+.

The call and treat a patient having a condition associated with the level of CD20. The treatment may further comprise the use of one or more the call in particular, the CD20 targetting nucleic acid may be contacted with the CCC treat lymphoma (NHL), bulky low-grade or follicular NHL, lymphocytic leukaemia, HIV (human immunodeficiency virus) associated NHL, lymphocytic lumphoma (NHL), immunodeficiency virus) associated NHL, mantle-cell lymphoma (ML), immunocytoma (IMC), small B-cell lymphocytic lymphoma (ML), immunocytoma (IMC), small B-cell lymphocytic lymphoma (ML), immunocytoma (IMC), small B-cell lymphocytic lymphoma (ML), immunocytoma (IMC), small B-cell lymphocytopathy, and inflammatory arthropathy. The NOGO targetting nucleic acid may be contacted with a cell to reduce NOGO activity of the nucleic acid may be contacted with a cell to reduce NOGO activity of the correct central nervous system (CNS) injury and cerebrovascular accident (CNS), atroke), Alzheimer's disease, disease, disease, ataxia, Huntington's disease, central nervous system (CNS) injury and cerebrovascular accident (CNS), atroke), Alzheimer's disease, ataxia, Huntington's disease, central selection of the modulation of che neurolesis (MS), disease, muscular additional content in a zinzyme mol

ò
 Novel enzymatic nucleic acid molecules which down regulates expression of a sequence encoding a subunit of nuclear factor kappa B useful for treating cancer, inflammatory disorders and autoimmune diseases.
 G-cleaver; amberzyme; cancer; REL-A activity; breast cancer; lung cancer; prostate cancer; colorectal cancer; brain cancer; oesophageal cancer; stomach cancer; bladder cancer; pancreatic cancer; cervical cancer;
 The invention describes an enzymatic nucleic acid molecule (I) which down
 regulates expression of a sequence encoding a subunit of nuclear factor kappa B (NRKB), where [1] is an inozyme, zinzyme, G-cleaver or amberzyme configuration. The enzymatic nucleic acid molecule is adapted to treat cancer and is useful for down-regulating REL-A activity in a cell, for treating a patient having a condition associated with the level of REL-A. [1] is useful for cleaving RNA comprising a sequence of REL-A gene, in the presence of a divalent cation, especially MG2+. The enzymatic and antisense nucleic acid molecules are useful for treating breast, lung,
 head and neck cancer; ovarian cancer; melanoms; lymphona; glioms; multidrug resistant cancer; REL-A-specific inhibitor; chemotherapy; pacliteaxel; docetaxel; cisplatin; methotrexate; cyclophosphamide; radiation therapy; inflammatory disease; asthma; diabetes; rheumatoid arthritis; restenosis; Crohn's disease; obesity; ischaemia; gene therapy; autoimmune disease; lupus; multiple sclerosis; sepsis; transplant/graft rejection; reperfusion injury; glomerulonephritis; allergic alrway inflammation; inflammatory bowel disease; infection; ss.

The present invention describes nucleic acid molecules which modulate the synthesis, expression and/or stability of a mRNA encoding 1 or more receptors of vascular endothelial growth factor (VBGF). A patient (preferably human) having a condition associated with the level of the fina-like trynosina kinase 1 (fit-1), kinase insert domain containing receptor (KDR) and/or foetal liver kinase 1 (fik-1) (e.g. tumour angiogenesis, ocular diseases, psoriasis and rheumatoid arthritis) can be traceded by administering the nucleic acid molecule or the expression vector to the patient. AAX67215 to AAX7572 represent specific examples of nucleic acid molecules from the present invention

 The present invention describes enzymatic nucleic acid molecules with RNA cleaving activity (e.g. ribozymes) which are capable of modulating the expression of plant genes: (i) involved in blosynthessis of alkaloids; or (ii) involved in flower formation. AAV9582 to AAV96334, and AAV9635 to AAV96354 represent potato solanidine glucosyltransferase hammerhead and harpin ribozymes, respectively. AAV95629 to AAV9591, and AAV96355 to AAV96734 represent potato solanidine glucosyltransferase target sequences. AAV96732 to AAV97710, and AAV97171 to AAV97171 to AAV97795 represent potato solanidine glucosyltransferase target sequences. AAV96735 to AAV96773 to AAV99770 represent potato citrate synthase target sequences. Ribozymes of the present invention can be used to inhibit the synthesis of toxic alkaloids in solanaceous plants, comparticularly poctato but also tomato, pepper, aubergine and ditura or to inhibit flowering in potato, lettuce, spinach, cabbage, brussel sprouts, arughla, Kale, collards, chard, beet, turnip, sweet potato and turf arughla, kale, collards, chard, be used for RNA manipulation in the same
 way that restriction endonucleases are for DNA, as well as to examine genetic drift and mutations in plants and to detect specific NAA. The ribozymes can be targeted to specific genes or to consensus sequences within a family of related genes, and being catalytic need to be present
 New enzymatic nucleic acid(s) - useful for, e.g. reducing alkaloid
biosynthesis or regulating flowering.

 The present invention provides single-stranded oligonucleotides which can be used for the targeted alteration of genomic sequences, where the oligonucleotide has at least one mismatch compared with the genomic sequence to be altered. In particular, these sequences are directed at the following genes: adenosine deaminase, p53, beta-globin, retinoblastoma, BRCA1, BRCA2, CFTR, cyclin-dependent kinase inhibitor 2A (CDKNAA), APC, Factor V, Factor VII, Factor IX, haemoglobin alpha locus apolipoprotein E (APOBS), LDL receptor (LDLR), UDP-glucuronosyltransferase (UGT1), amyloid precursor protein (APC), presentlin-1 (PSEN1) and presentlin-2 (PSEN2). These can be used in the gene therapy of diseases

 The invention relates to nucleic acid molecules that modulate replication of the West Nile Virus (WNV). The nucleic acid molecules are useful for treating a condition related to WNV infection e.g. pancreatitis, encephalitis, waycarditis, meningitis, neurologic infection, hepatitis, liver failure, hepatocellular carcinoma or cirrhosis. The nucleic acid molecule is selected from the group of ribozymes consisting of Hammerhead, Inozyme, G-claaver, DNAzyme, Amberzyme and Zinzyme. The nucleic acid molecules further comprise at least five ribose residues, at least the 2'-O-methyl modifications, phosphorochiadre linkages on at least three of the 5' terminal nucleotides and a 3' and modification of a 3'-3' inverted abasic moiety. Nucleic acid molecules SEQ ID NO 1 to 37080 are claimed; however, SEQ ID NO 2194-2206 and 17502-17514 are not given molecule of the invention

The present invention relates to novel human zinc finger-containing proteins and their coding sequences: MDZ3, MDZ7, MDZ7, MDZ12. MDZ3 is encoded at chromosome 7q22.1, MDZ4 is encoded at chromosome 16p1.2 and MDZ12 is encoded at chromosome 16p2.2 and MDZ12 is encoded at chromosome 2 associated with decreased or increased expression or activity of MDZ3. MDZ4, MDZ7, or MDZ12. The nucleic caused by altered expression of MDZ3, MDZ4, MDZ7, or MDZ12. The nucleic acids can also be used as probes to detect and characterize gross alterations in MDZ3, MDZ4, MDZ12 genetic locus. The probes are useful in constructing microarrays for measuring gene expression. The proteins are useful as theraputic agents for gene therapy or as proteins. The present sequence was used to illustrate the invention.

The present invention relates to nucleic acid molecules which modulate the synthesis, expression and/or stability of Hepatitis C virus (HCV) or Hepatitis B virus (HBV) RNA. The nucleic acid molecules include antisense and enzymatic nucleic acid such as hammerhead ribozymes, DNAzymes, inozymes, zinzymes, amberzymes, and G-cleaver ribozymes. Also disclosed are nucleic acid decoy molecules and aptamers that bind to HBV reverse transcriptase primer sequences, as well cranscriptase and/or HBV reverse transcriptase primer sequences, as well cas oligonuclectides that specifically bind the Enhancer I region of HBV DNA. The nucleic acids may be used to modulate the expression of HBV compounds and/or potential therapies directed against HBV, and compounds compounds and/or potential therapies directed against HBV, and compounds methods of the invention are useful for the treatment of degenerative and disease states related to HBV and HCV infection, replication and gene expression such as cirrhosis, liver failure, and hepatocellular carcinoma. The present sequence represents a substrate for one of the HCV DNAzyme or minus strand DNAzyme sequences disclosed in the present
 Novel compound useful for treating cirrhosis, liver failure, hepatocellular carcinoma, or condition associated with hepatitis C virus

 The invention relates to a novel isolated nucleic acid that encodes a protein with a chromatin organisation modifier (CHROMO) domain. The polymuclectide of the invention demonstrates cytostatic activity and may be useful for preparing a composition for treating or preventing a disorder associated with decreased or increased expression or activity of PCCP1 (prostate cancer candidate protein 1), such as a tumour, as well as during gene therapy and vaccine production procedures. The current sequence is that of the human PCCP1-related DNA fragment SEQ ID 4-directed probe of the invention. Note: The current sequence is not shown
 New prostate cancer candidate protein 1 (PCCP1), useful for preparing composition for treating or preventing a disorder associated with decreased or increased expression or activity of PCCP1 e.g., tumor.

```
The invention comprises nucleic acids (e.g. antisense oligonucleotides) that down regulate the expression or inhibit the function of a receptor for a meurite growth inhibitor, NOGO, prostaglandin D2 receptor (PTCDR), IkappaB kinase (IKK), or protein Kinase PKR. The nucleic acids of the invention are useful for treating: cerebrovascular accident, central charvous system (CMS) injury, spinal cord injury, ancer (e.g. melanoma, lymphoma or gliona), inflammatory disease (e.g. rheumatoid arthritis, restenosis or asthma), Crohn's disease, diabetes, obesity, autoimmune disease, lupus, multiple sclerosis, transplant/graft rejection, is chaemia/reperfusion injury, glomerulonephritis, sepsis, and allergic conditions (e.g. asthma, allergic rhinitis or atopic dermatitis). The nucleic acids of the invention are also useful for down-regulating the cypression of a target gene and as a diagnostic tool to examine genetic drifts and mutations within diseased calls or to detect the presence of a target RNA in a cell. The present RNA sequence represents a human PRR

Enzymatic nucleic acid molecules which specifically cleave RNA derived from hepatitis C virus (HCV), useful for the treatment of HCV infections, especially in combination with type I interferon therapy.
 The invention relates to an enzymatic nucleic acid molecule which specifically cleaves RNA derived from hepatitis C virus (HCV), in which the binding arms of the enzymatic nucleic acid molecule comprises sequences complementary to any of the defined substrate sequences given in the specification. The nucleic acid molecule may be administered for the treatment of HCV infections, especially in combination with type I interferons. The present sequence represents a HCV DNAzyme substrate

The invention relates to a novel polypeptide (I) comprising a sequence (S1) of myosin-like protein-1 (hGDMLP-1) having 2568 amino acids fully defined in the specification, a fragment of at least 8 amino acids of (S1), 95% deviation from (S1) which are conservative substitutions, and 65% identity to (S1). A polypetide of the invention acts as a agonist or antagonist of hGDMLP-1, or as an inhibitor of hGDMLP-1 activity. A pharmaceutical composition of the invention is useful for treating or preventing a disorder associated with decreased expression or activity of hGDMLP-1, such as a disorder of heart and/or skeletal muscle function. The present sequence represents a 17-mer nucleotide, used in the

The specification describes a DNAzyme which selectively cleaves a mutant polynucleotide by cleaving at a site remote from the mutation site. The polynucleotide by cleaving at a site remote from the mutation site. The DNAzyme binds selectively to a mutant allele or its expressed product, and comprises a central catalytic motif (Helix II) and two flanking regions the sequence complementary to a region that includes the mutation in the mutant allele or to that of the expressed product. Both flanking regions are complementary to mutated regions of the mutant of the mutant allele or to that of the expressed product. Both flanking regions are complementary to mutated regions of the mutant of the mutant allele or to downstream of the site of cleavage, preferably in complementary to mutated regions of the mutant of the site of cleavage, preferably in comprises upstream of the site of cleavage, preferably in comprises a stem-loop structure at either or both teaming the flanking regions comprises ribonucleic acid. The DNAzyme is useful in therapy, in particular for the camplement of a disorder associated with a mutant allele in a patient, where the DNAzyme comprises a central catalytic motif and two flanking substrate-binding regions in the mutant of catalytic motif and the site of mutation. The disorder is a dominantly inherited catalytic motif from the site of mutation. The disorder is a dominantly inherited and schondroplasia, amount object is a dominant DNA marfan syndrome, hypercholesterolemia, osteogenesis imperfect and Schoolsof-Abd366-Abd366-Abd3667-Eposent the wild type and mutant DNAzyme comprises are suitable for the design of DNAzymes of the invention cours, and and an and such and causes amyotrophic lateral sclerosis.
 New DNAzyme that cleaves mutant polynucleotides, useful in treating a dominantly inherited disorder associated with a mutant allele, such as achondroplasia, amyotrophic lateral sclerosis, Marfan syndrome and

The invention relates to a method of simultaneously determining the presence of 2 or more sequence variations in target nucleic acids, or simultaneously monitoring expression of 2 or more genes. The method comprises determining differences in hybridisation between the target nucleic acid and immobilised probes, where differences in hybridisation between indicates sequence variations or transcriptin levels. The method is used for simultaneously determining the presence or absence of two or more sequence variations in target nucleic acids or simultaneously monitoring expression of two or more genes in target nucleic acids. The methods are applicable to high-throughput genotyping of known and unknown polymorphisms and mutations. The method maximises the information yield of hybridisation-based array applications by increasing the number of informative array-immobilised polymucleotide probes. The present sequence represents N-acetyltransferase 2 (NMT2) G191A single nucleotide polymorphism (SNP) hybridisation probe #7
 Determining sequence variation in, or monitoring expression of genes in target nucleic acid for high-throughput genotyping of (un)known polymorphisms/mutations, comprises hybridization pattern differences
 between target and probe sequences.

The specification describes a DNAzyme which selectively cleaves a mutant polynucleotide by cleaving at a site remote from the mutation site. The DNAzyme binds selectively to a mutant allete or its expressed product, and comprises a central catalytic motif (Helix II) and two flanking regions (helix I and III) where at least one of the flanking regions has complemented regions of the mutant allele or the expressed product. The complement of the mutant both cancelotides upstream or downstream of the site of cleavage, preferably in callele or the expressed product. The complement of the mutant is so allele or the expressed product. The complement of the mutant is complementary to mutated regions of the mutant both site is complementary to mutated regions of the mutant. Both comprises of different lengths, where helix I is so necessary than helix III, and their lengths is site of cleavage, preferably in the lix I preferably comprises 9 nucleotides and helix III is nucleotides. Helix I preferably comprises 9 nucleotides and helix III is nucleotides. At least one of the flanking regions comprises ribonucleic acid. The terminus. The DNAzyme is useful in therapy, in particular for the terminus. The DNAzyme is useful in therapy, in particular for the manufacture of a medicament for the treatment of a disorder associated catalytic motif and two flanking substrate-binding regions, and where at catalytic motif and two flanking substrate-binding regions, and where at least one flanking region binds at the site of mutation in the mutant and the site of mutation. The disorder is a dominantly inherited and SCCMS. The present sequence represents a fragment from a DNAzyme for the Cu/Zn superoxided disputes (SDDI) gene where a GIZR mutation occurs and causes amyotrophic lateral sclerosis.

 PCR primers and probes ABZ68235-42 are based on highly conserved regions of the spood gene of the spore-forming bacteria Bacillus and Clostridium. They are used for detecting the presence of spore-forming bacteria in a sample. The probes are useful for testing a sample comprising air, soil, water, blood, faecal matter, starch, protein or an epichlorohydrin reaction product for the presence of spore forming bacteria. They are useful for detecting spore forming bacteria. They are useful for detecting spore forming bacteria in sporeforming bacteria. They are useful for detecting spore forming bacteria products and paper making processes, protein-containing samples, and medical diagnostic applications
 The invention relates to methods for the systematic identification of sporulation genes in spore forming bacteria (SFB). The method is useful for identifying sporulation genes in spore forming bacteria. It is also useful for detecting the presence of SFB in sample e.g., paper pulp. The present sequence is a PCR primer used for amplifying spore forming bacteria spool gene. This sequence is used to illustrate the method of the invention.
 Novel primer pair useful for identifying sporulation genes in spore forming bacteria and detecting the presence of spore forming bacteria in samples e.g. paper pulp.

ö
 The specification describes antisense oligonucleotides (AAX52869-X55271) directed against at least 2 mRNAs selected from target genes, coding and non-coding regions of RNAs corresponding to target genes, gene initiation codons, genomic flanking regions, intron-exon borders, the 5'-end, the 3'-end and the juxta-section between coding and non-coding regions and all segments of RNAs encoding proteins associated with one or more diseases, conditions or mixtures. The antisense oligonucleotides may be derived from sequences AAX55272-74. These multiple target oligonucleotides (specifically AAX55180-271) can be used for the antisense treatment of
 diseases and conditions. Typical diseases and conditions are those associated with impaired respiration and inflammation, including lung diseases, pulmonary vasoconstriction, inflammation, allergic rhinitis, acute asthma, allergies, asthma, impeded respiration, respiratory distress syndrome, pain, cystic fibrosis, pulmonary hypertension, pulmonary vasoconstriction, emphysema, chronic obstructive pulmonary disease (CODD), and cancers such as leukemias, lymphomas, carcinomas e.g. colon cancer, breast cancer, lung cancer, pancreatic cancer, hepatocellular carcinoma, kidney cancer, melanoma, hepatic metastases, as

The present invention describes a new composition comprising an antisense cligonucleotide (ON) with low adenosine (up to 15%), which targets nucleic acids involved in bronchoconstriction, allergies, and/or inflammation. The ON can have antihiflammatory, antiallergic, and are consistent and analyses activities. The compositions are useful for the treatment of diseases associated with inflammation, impaired airways, including lung disease and diseases whose secondary effects afflict the lungs of a subject. They can be used for treating e.g. ischaemic conditions, pulmonary vasconstriction, allergies, asthma, impeded respiration, respiratory distress syndrome, pain, cystic fibrosis, pulmonary disease (COPD), and cancers such as leukaemias, lymphomas, carcinomas, and cancers which may metastisse to the lungs, including breast and prostate cancer. The reduction of the adenosine content of the constant of decoxyadenosine which activates adenosine receptors causing release of decoxyadenosine which activates adenosine receptors causing bronchoconstriction and inflammation. The present invention describes low adenosine (A) content antisense oligonucleotides and compositions (I) comprising them. In the antisense oligonucleotides the A is replaced by a 'Universal' or alternative base. (I) can have respiratory, bronchodilator, antinflammatory, analgesic, immunosuppressive, antiasthmatic, hypotensive and cytostatic activities. The antisense oligonucleotides and (I) can be used to down-regulate the expression and or activity of target polypeptides associated with lung/respiratory disorders and malignancies, such as stimulating and activating peptide factors and transmitters, transcription factors,

WPI; 2003-229219/22.

Pharmaceutical composition for treating allments associated with impaired respiration, has oligo(s) antisense to specific gene(s) or its corresponding RNAs, and glucocorticoid or non-glucocorticoid steroid or ubiquinone.

Disclosure; SEQ ID NO 11110; 872pp; English.

The invention relates to a novel pharmaceutical composition, which has a first active agent comprising an oligonuclectide antisense to the initiation codon, coding region, 5' or 3' end genomic flanking regions, 5' and 3' intron-exon junctions, or regions within 2-10 nucleotides of junctions of genes encoding a polypeptide associated with lung and/or 

nasal airway dysfunction and a second active agent comprising an antinifiammatory steroid and ubiquinone. A composition of the invention has antiinflammatory, antialergic, antiasthmatic, hypotensive, immunosuppressive, and cytostatic activity. The composition may have a use in antisense gene therapy. The composition is useful for treating or preventing a respiratory, lung or malignant disease or condition, also for enhancing the prophylactic or therapeutic respiratory effect of an antiinflammatory steroid in a subject, for reducing or depleting levels of, or reducing sensitivity to adenosine, reducing levels of adenosine receptor, producing bronchodilation, increasing levels of ubiquinone or lung surfactant in a subject's tissue, or treating bronchoconstriction, lung allergies, or a respiratory disease or condition. Note: The sequence data for this patent is not represented in the printed specification, but was obtained in electronic format directly from WIPO at ftp.wipo.int/pub/published\_pct\_sequences

New Myrothecium host cell comprising at least one recombinant DNA construct, useful as cell factory for industrial enzyme and/or protein production for producing therapeutic drugs, and as source of biopesticide.

Example 3; SEQ ID NO 31; 83pp; English.

The present sequence is that of PCR primer AMY5. In an example from the invention, this primer and primer GPD2 ADM56221 for the glyceraldehyde-3-phosphate dehydrogenase (GPD) promoter were used to detect the presence of amylase expression vector D2G-S in Myrothecium sp. transformants, verifying integration of the vector in the Myrothecium genome without

```
ö
 was used to transform Myrothecium gramineum (8yn. Xepiculopsis graminea) strain MUCi39210 and Aspergillus niger MUCi28817 protoplasts. On average, the Myrothecium transformants produced 2.75 times more alpha-amylase than the Aspergillus transformants. The invention relates to the use of wyrothecium spp. as host cells. Myrothecium sp. as host cells. Myrothecium sp. phost colls were found to be easy to transform, easy to culture, to have a high growth rate coupled to high biomass production, and to be suitable for large-scale or industrial production of proteins of interest, such as enzymes (e.g. amylase or xylanase) or therapeutic drugs. Applications include protein and/or enzyme production for food and/or therapeutic applications and the use of transformed Myrothecium as a biopesticide (claimed).
amplification of the endogenous amylase gene or GPD promoter. The vector

The invention comprises a method for detecting target molecules. The method involves; determining the electronic status of a semiconductor, establishing electronic communication between the target molecules and the semiconductor, subjecting the semiconductor to energy influx sufficient to produce a charge pair separation on the semiconductor's surface (thereby generating an electronic signal), prolonging the charge separation via a semiconductor surface-modifying molecule, and redetermining the electronic status of the semiconductor by amplifying the electronic signal. The method of the invention is useful for detecting target molecules, biological molecules, and target groups. The

This invention describes novel oligonucleotide primers or peptide nucleic acid (PNA) oligomers for detecting single nucleotide polymorphisms (SNP) and cytosine methylation status in chemically pretreated genomic DNA. The oligonucleotides are used for diagnosis and/or prognosis of cancer and a range of diseases including immune system, gastrointestinal, respiratory, central nervous system, cardiovascular and metabolic disorders. The oligomers are also used for detecting cell type differentiation. ABC0010-ABC99989, ABF00010-ABF9989, ABH00010-ABH99989 and ABI00010-ABI82073 represent the oligomers described in the invention. NOTE: The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format from WIPO at

 This invention describes novel oligonucleotide primers or peptide nucleic acid (PNA) oligomers for detecting single nucleotide polymorphisms (SNP) and cytosine methylation status in chemically pretreated genomic DNA. The oligonucleotides are used for diagnosis and/or prognosis of cancer and a range of diseases including immune system, gastrointestinal, respiratory, central nervous system, cardiovascular and metabolic disorders. The oligomers are also used for detecting cell type differentiation. ABC00010-ABC99889, ABF00010-ABF99889, ABR00010-ABF99889 and ABI00010-ABF3073 represent the oligomers described in the invention. NOTE: The sequence was obtained in electronic format from WIPO at the printed specification, but ftp.wipo.int/pub/published_pct_sequence

paraxonase 2 (PON2) isogene. Primers and probes allow identification of this sequence and its polymorphisms and are useful for identifying which isoform of paraxonase 2 a person carries. Identification of a PON2 isoform allows tailored pharmaceutical treatment to be designed and administered. PON2 is a particularly important gene for the treatment of coronary heart disease. This sequence represents an allele specific oligonuclectide (ASO) primer used for detecting PON2 gene polymorphisms, described in the method of the invention
 The invention describes an isolated polynucleotide sequence comprising a
 An isolated polynucleotide comprising a paraxonase 2 (PON2) isogene encodes a pharmaceutically important protein for the identification of polymorphisms at the PON2 locus.

The invention relates to a compound of 8-50 nucleobases in length, targeted to a nucleic acid molecule encoding human superoxide dismutase 1 by hybridises with and inhibits the expression of human superoxide dismutase 1 by hybridising with at least an 8-nucleobase portion of the nucleic acid molecule encoding the active site of the enzyme. The activity of compounds of the invention may be described as neuroprotective, cytostatic and antiinflammatory. The mechanism of action of compounds of the invention is antisense inhibition of finana superoxide dismutase 1 expression by chimeric phosphorothicate oligonucleotides having 2'-methoxyethyl (2'-MOE) wings and a deoxy gap. Compounds of the invention are useful for inhibiting the expression of human superoxide dismutase 1 in human cells or tissues, and for treating a disease or condition associated with this enzyme (antisense therapy), especially amyotrophic lateral sclerosis, a disease or condition arising from abbrrant apoptosis and a hyperproliferative disorder. It may also be
 ö
 used in diagnostics, therapeutics and as a research reagent, e.g. prophylactically to prevent or delay infection, inflammation or tumour formation. Sequences given in records ACC40880-ACC40957 represent human superoxide dismutase 1 antisense inhibitor oligonucleotides

 The invention relates to a novel method and a DAM chip for monitoring a response of cancer patients to irradiation therapy using antioxidant gene expression analysis, thereby accurately anticipating the response to irradiation therapy and minimizing adverse side-effects thereof. A method for monitoring a response of cancer patients to irradiation therapy comprises: collecting a peripheral blood cell from a human; irradiating the peripheral blood cell; extracting RNA according to the time period; preparing DNA from the RNA; hybridizing the DNA with antioxidant enzyme CDNA; amplifying the hybridizing the DNA with antioxidant enzyme CDNA; amplifying the hybridized DNA using one or more pairs of primers selected from: DNA fragments of ADT66491 and ADT66492; DNA fragments of ADT66492; DNA fragments of ADT66499; DNA fragments of ADT66499; and analyzing ADT66499; and ADT66499; DNA fragments of ADT66499; and ADT66499; an

 The present sequence represents a specifically claimed oligonucleotide PCR primer. The oligonucleotide can be used for polymerase chain reaction (PCR) amplification of DNA, specifically regions of specific genes that are conserved among mammalian species, i.e. pairs of oligonucleotides from the present specification represent universal mammalian sequence-tagged site (UW-STS) primers. The primers are used to develop genomic maps, to isolate clones from libraries, to make cross-species comparisons and to develop additional genetic markers. UM-STS allow genomic comparisons to be made between more species
gene sequence. The transgenic rat can be used in the investigation of the pathology and the onset mechanism of ALS. The present sequence represents a PCR primer which is used in an example from the present invention

The present invention relates to a method for the direct comparison of numerical gene expression values between samples of genes. The method comprises amplifying cDNA in the presence of a competitive template mixture and primer pairs for several genes and then amplifying aliquots of the PCR products using a primer pair specific for each gene. The method of amplification is by multiplex standardised reverse transcriptase-polymerase chain reaction (StaRT-PCR). High density oligonucleotide or cDNA arrays are used to measure PCR products following quantitative StaRT-PCR. The method is useful for the assessment of gene expression in small biological samples such as fine needle aspirate biopsies, and laser captured microdissected materials. The method allows for the standardised measurement of hundreds of genes from the same sample, which in prior art, could only be assessed for one gene. The present sequence represents a multiplex StaRT-PCR primer which can be

New transduction domain-target protein-transduction domain fusion protein having the ability to be transduced into a cell, useful for delivering a functional protein (i.e. superoxide dismutase) into a cell at enhanced efficiency

Disclosure; Page 38; 47pp; English.

The present invention relates to a transduction domain-target proteintransduction domain fusion protein having the ability to be transduced into a cell, where the transduction domain is covalently bonded to each of the amino- and carboxyl-terminal ends of the target protein. The fusion protein is useful for delivering a functional protein or peptide (i.e. superoxide dismutase) into a cell at enhanced efficiency. The composition may be used in protein therapy where the superoxide dismutase playing a main role in removing reactive oxygen species is delivered into cells to treat diseases. It may be used in cosmetic and health food industries, in addition to treating various diseases, such as aging or

The invention relates to a composition that comprises 2-methoxyestradiol and an agent that increases intracellular superoxide anion. 2-methoxyestradiol inhibits superoxide dismutase (SOD) including cytosolic SODI (CuZn-SOD) and mitochondrial SOD2 (Mn-SOD). It compromises the cell's ability to eliminate superoxide anion. The composition can be used for killing cells (preferably cancer cells derived from a solid tumour especially leukemia cells) in humans; for treating cancer in humans.
 and an agent that increases intracellular superoxide anion. 2-methoxyestradiol inhibits superoxide dismutase (SOD) including cytosolic SOD1 (Uncl.SOD) and mitochondrial SOD2 (Mn-SOD). It compromises the cell's ability to eliminate superoxide anion. The composition, can be used for killing cells (preferably cancer cells derived from a solid tumour especially leukemia cells) in humans; for treating cancer in humans. Sequences ABA94685-686 represent PCR primers for amplifying SOD1 cDNA

 Diagnosis, treatment and prevention of diseases of cell death - e.g. amyotrophic lateral sclerosis, which are the result of e.g. decreased SOD activity.
 (SODI, SOD2 or SOD3) indicates an increased likelihood of developing a cell death disease, specifically a neurodegenerative disease. The DNA can be analysed to detect mutant SOD sequences. Analysis is pref. preceded by a PCR amplification step. AAQ67476. AAQ67485 are examples of PCR primers which are useful for diagnosis of diseases linked to SODI mutations. (Updated on 25-MAR-2003 to correct PN field.)

The present sequence is a human superoxide dismutase (SOD1) wild-type sequence, which was used to demonstrate the method of the invention. The invention provides methods of specifically inhibiting the expression of a mutant allele, while preserving the expression of a co-expressed wild-type allele, using RNA interference (RNAi). The methods are useful for type allele, using RNA interference (RNAi). The methods are useful for treating a subject having a disorder correlated with the presence of a dominant gain of function mutant allele, e.g. amyotrophic lateral.

Alzheimer's disease, and Parkinson's disease (Claimed). To test whether small hairpin RNA (shRNA) can selectively block the expression of a mutant but not wild-type SOD1 expression, a plasmid was constructed that synthesised an shRNA ADO43056 homologous to a disease-causing mutant SOD1, G33A (nucleotide change from G to C at nucleotide position 281, placing a G:G mismatch at selective sites between the shRNA and wild-type SOD1 wild-type or mutant SOD1-GFP that when co-transfected with either wild-type or mutant SOD1-GFP plasmids, this construct triggered single-nucleotide selective RNAi of

The present invention relates to a method for suppressing gene expression in cells, particularly eukaryotic cells. The method involves a new nucleic acid comprising in a 5'-3' order: an RNA polymerase promoter sequence, a first target sequence that is essentially complementary to a sequence of a target nucleic acid or its complement, a spacer sequence, a sequence that is essentially complementary to the first target sequence that is essentially complementary to the first carget sequence, and an RNA polymerase termination signal, where an RNA transcribed from the nucleic acid can inhibit expression of the target gene. The RNA transcribed from the nucleic acid may form a halfpin cstructure. The polymerase is preferably RNA polymerase III (Pol III) and structure. The polymerase is preferably RNA polymerase III (Pol III) and sufficient for arresting Pol III activity. The nucleic acids and methods are useful for suppressing gene expression in cells, or inhibiting the subject. The nucleic acids can be used for treating various diseases by inhibiting the expression of abnormal or mutated proceins, e.g. cancers nuclease leaves including Alzheimer's disease, Parkinson's disease, Huntington's disease and amyotrophic lateral sclerosis (ALS).

The present sequence represente a partial DNA sequence from the wild-type by the sequence represented the partial DNA sequence from the wild-type. protein in a eukaryotic cell, or for treating various diseases by inhibiting the expression of abnormal or mutated proteins, e.g. leukemia, viral or bacterial infection. Superoxide dismutase mutant allele target for RNA interference.

(first entry)

12-AUG-2004

```
ö
 The present sequence is a human superoxide dismutase (SODI) mutant allele target sequence for RNA interference (RNAi). In comparison to the wildtype allele ADO43047, a single nucleotide change of guanosine to cytosine at position 256 (relative to the start of translation) causes a Gly to Arg mutation (G85R). The invention provides methods of specifically inhibiting the expression of a mutant allele, while preserving the expression of a mutant allele, while preserving the expression of a mutant allele, using RNA interference (RNAi). The methods are useful for treating a subject having a disorder correlated with the presence of a dominant gain of function mutant allele, e.g. amyorrophic lateral sclerosis (ALS), Huntington's disease, and Parkinson's disease (claimed). Small interfering RNAs (siRNA) are provided ADO43041-ADO43046 that selectively suppress mutant, but not wild-type, expression of SODI, which causes inherited

 The invention relates to a system for detecting gene expression, which comprises one or two isolated DNA molecules that detect expression of a gene, where the gene corresponds to any of 8143 oligonucleotides (ABZ00010-ABZ00152) each having 50 base pairs (bp). The system is useful for leukocyte expression profiling. It is particularly useful for predicting disease, monitoring (rate of) progression of a disease, predicting therapeutic outcome, determining prognosis for a patient, predicting disease complications in an individual or monitoring response to treatment in an individual. The diseases include cardiac allograft rejection, kidney allograft rejection, liver allograft rejection, atherosclerosis, congestive heart failure, systemic lupus erythematosus, rheumatoid arthritis, osteoarthritis or cytomegalovirus infection
